

THE ZERO MACHINE

How Madwell Was Turned into a Financial Reservoir, Drained, and Left Behind

MADWELL EVIDENTIARY SYNTHESIS | COUNSEL BRIEFING DECK | SEPTEMBER 2, 2026

Abstract. This briefing finds that Madwell, an independent creative and marketing agency headquartered in Brooklyn, was converted from a real operating company into a financial reservoir. David Eisenman commissioned the reporting result before Daniel Tucker entered Madwell. Tucker, first deployed through Anchin's outsourced-accounting channel and then installed as Madwell's chief financial officer on November 1, 2018, professionalized and operated the resulting architecture. Greg Wank was Anchin's outsourced-accounting engagement partner, Marc Newman coordinated the deployment and was Tucker's identified supervisor, and Michael Belfer was the relationship and tax partner who later appears at basis and exit-planning gates. The structure exploited the difference between cash and accrual bookkeeping so that value could be suppressed, held, released, reassigned, and ultimately left behind as debt and obligation.

Madwell was not a conventional fee-only advertising agency. It operated more like a vertically integrated production studio. The company conceived campaigns and then, through Madwell and its controlled production network, made much of what it had conceived: commercials, music, live events, physical sets, experiential installations, and licensed merchandise and apparel. That distinction determined the economics. If an agency bills a client \$100, pays an unrelated production vendor \$70 at cost, and keeps a \$30 fee, the \$70 is a genuine pass-through. But when Madwell or a Madwell-controlled production company performed the work, the same \$70 represented business conducted inside the enterprise: revenue, cost, margin, labor, and enterprise value. Calling both situations "pass-through" erased the difference between money Madwell merely transmitted and work Madwell actually sold and produced.

A subsequent contract-to-cash reconstruction closes that economic-origin layer. In the same 2018–2023 period, an independent line-level remap recovers \$123.750 million of Verizon/Visible activity—89.70 percent of Madwell's \$137.966 million of filed gross receipts for all clients combined. The broader 2018–2024 Verizon-family ledger schedule totals \$137.996 million, only \$30,009 above the entire six-year filed topline. Meanwhile, native client and job fields carry \$121.658 million of BILL.com Paid objects to one controlled client or entity address, including \$84.842 million inside the 1072 clearing population. The visible filed company was therefore almost one client while the internal and payment records preserved a much larger multi-client production economy. Those client addresses identify whose work generated the obligations; they do not by themselves identify the final recipient of pooled cash.

That false equivalence became the Zero Machine. Hayley Rogers was Madwell's first in-house Vice President of Finance—the first person beyond outside accountants and outsourced firms to hold a senior finance position inside the company. Beginning in 2017, she built an internal system that at-

tached client, project, labor, card, bill, bank, and ledger identity to the same economic work. Eisenman selected the required accounting result in 2018. Through Madwell's established relationship with Belfer and Anchin, Tucker replaced Rogers's identity-preserving design with a finance-controlled system of spreadsheets, imports, hosted books, clearing accounts, deferred-revenue schedules, and paired journal entries. Equal revenue and cost could be removed together; related-company production could be treated like an at-cost outside payment; revenue and direct cost could be deferred, reversed, or moved between entities and periods; and the locally balanced ledger would preserve gross profit while making the larger company disappear. In January 2022, for example, Madwell's ordinary profit-and-loss statement showed \$5.712 million of income, \$2.643 million of direct cost, and \$3.069 million of gross profit. Tucker's leadership package presented the \$3.069 million gross-profit remainder as "SALES." The company did not become a \$3.069 million business. Its \$5.712 million of activity had been compressed into its margin.

Across 2018 through 2023, Madwell's six internal year-end statements recorded \$279.544 million of Total Income, while its filed partnership returns reported \$137.966 million of gross receipts. The difference—\$141.578 million—is the amount of internally recorded topline subjected to the zeroing treatment. It was not an accounting convention applied only at year end. The same method appears in paired eliminations of revenue and cost of goods sold (COGS), monthly deferral and reversal entries, related-company reductions, gross-profit-as-sales presentations, intercompany accounts brought back to zero, and different financial packages prepared for company leaders, lenders, tax authorities, and government programs.

QuickBooks account 1072 was the machine's principal cash-release chamber. It was not a bank account. It was a synthetic clearing account inside the books connected to BILL.com, Madwell's bill-payment platform. A pooled withdrawal from Madwell's bank could fund a bundle of BILL.com payments; the individual vendor objects were then posted against 1072 until the clearing account returned to zero. The aggregate bank movement and the individual payment stories balanced in QuickBooks, but the clearing layer separated the cash leaving the bank from the identity, payment profile, and final destination of each purported vendor payment. Tucker wrote that 1072 "should usually be zero." The point of the account was therefore not to preserve cash in place, but to permit cash to leave through a pooled channel while the ledger erased the intermediate imbalance.

The second release rail was older. Bernard D. Malaky was Eisenman's former roommate and friend when Eisenman and co-founder Christopher Sojka—Madwell's commercial and creative leader—established Madwell in 2010. In 2011, Malaky supplied a disclosed startup credit accommodation and offered the founders practical use of the card and pay-

ment setup. The accommodation was not necessarily fraudulent when created, but it established the topology later used by the Zero Machine: company activity could appear under Madwell or Eisenman on the issuer and accounting side while Madwell's bank released the exact same amount under an outside individual's identity. From 2018 through 2024, the canonical bank record contains 242 Bank of America automated-clearing-house (ACH) withdrawals bearing Bernard D. Malaky's name and totaling \$23.114 million. The same amounts reappear as American Express (AMEX) payments and Madwell card-liability entries across multiple card endings and book accounts. In operational terms, that was the rail: once the ACH left Bank of America under Malaky, the books treated the corresponding Madwell AMEX liability as settled and the cash was outside Madwell. The old arrangement remained active after BILL.com became dominant and was used throughout 2022 and 2023, making it both the precursor to the later architecture and a retained fallback within it.

Hong Kong provides a contained demonstration of the same inversion. Sojka won the Danone/Nutricia client business and Madwell built a Hong Kong operating affiliate to perform it. Tucker's August 2021 "Financials for David" package first showed a conventional profit and loss with HK\$19.811 million of income, HK\$14.296 million of cost of goods sold, and HK\$5.515 million of gross profit. Later in the same package, media billings and cost of goods sold were zero and the same HK\$5.515 million gross-profit remainder occupied the Total Income position. Bank records separately show Madwell U.S. sending \$7.996 million to Madwell Hong Kong and receiving \$1.797 million back, while QuickBooks intercompany account 16030—the account meant to record what the U.S. and Hong Kong companies owed each other—was returned to zero after write-off and reversal entries. The ledger closed; Madwell U.S. remained \$6.199 million out of pocket.

The structure also changed what outside institutions were asked to believe. It put more than \$6.5 million of federal pandemic relief, forgiveness, and tax credits at issue: \$2.148 million of first-round Paycheck Protection Program (PPP) proceeds, \$1.938 million of second-round PPP forgiveness, and a \$2.51 million Employee Retention Credit (ERC) claim. The first PPP receipt was followed the same day by a \$1.5 million repayment to Madwell's Bank of America revolving credit line. For the second PPP round, 99.55 percent of the qualifying revenue decline signed by Tucker as chief financial officer came from the pass-through category, while fee revenue declined only 0.79 percent. On the day Tucker signed the second-round forgiveness recertification, Madwell borrowed \$4 million, combined it with other company cash, wired \$5 million to Eisenman for a balance screenshot, and received the money back. ERC workpapers separately preserve a \$1.628 million "Plan to delay" around the governing receipt thresholds and a qualifying-wage population expanded across successive Tucker workbooks. The zeroing system did not merely describe the company after the fact; it supplied the revenue, payroll, liquidity, and eligibility inputs presented to the government.

Bank of America financed the reservoir while the same reporting structure obscured where the borrowed capacity went. Madwell's revolving credit line rose from \$4 million to \$6

million as reviewed statements and compliance certificates went missing, covenant failures accumulated, and Madwell liquidity entered related companies and personal or property routes. In 2022, Madwell borrowed \$2.6 million and sent it to Eisenman's personal account; \$2.384 million is traced into 195 Throckmorton, a property-holding company allocated to Eisenman, while Madwell retained the debt. By May 2023, Bank of America demanded \$4.75 million in repayment. The final amendment ended the revolving feature, imposed accelerated repayment and liquidity restrictions, and pledged related operating companies as guarantors. The benefit had moved; the debt, defaults, liens, guarantees, and operating burden remained with Madwell.

The cash side supplies a second vantage point on the same object. QuickBooks 1072 records \$118.908 million of disbursement-side movement. The broader direct-AMEX bank family adds \$23.889 million. Crediting \$1.048 million of identified inbound cash items produces \$141.749 million of net release through 2024. That cash field is only \$171,072 greater than the \$141.578 million statement field—a difference of 0.12 percent. The near-closure does not mean that every suppressed dollar has already been assigned to a final beneficiary. It means the operation has a measurable stock-flow body: the amount removed from Madwell's visible economic scale and the amount released through its two principal rails are two independently reconstructed views of virtually the same six-year machine.

Transaction records show how the machine stole within that field. It changed vendor payment destinations and the names, addresses, tax identities, and payment methods attached to them; funded card payments whose reporting obligation moved away from Madwell; marked obligations paid or received without the represented cash settlement; returned and reissued payments through clearing; preserved duplicate payment states; routed company borrowing to personal, property, and affiliate endpoints while Madwell retained the debt; converted a failed company wire into false Sojka owner history; stripped client and project identity during the migration from the original QuickBooks Desktop ledger to QuickBooks Online and Ramp, the successor accounting and payment platforms; and continued rewriting bills, vendors, payment methods, credits, and tax records after Madwell stopped operating. The chronology begins with the 2011 Malaky precursor, turns on the 2017–2018 displacement of Rogers and installation of Tucker, follows Tucker's recurring production layer—Russell Ieong inside Madwell and M&S Global, the outsourced accounting firm formally known as Manubhai & Shah LLP—and ends with the 2024 drain, the incomplete transfer of control, Madwell's April 2025 closure, and continued post-close reconstruction. The \$141.578 million reservoir is the measured field in which the paper identifies the specific thefts, private and affiliate benefits, false settlements, government and lender consequences, burden shifts, and remaining endpoint populations. The company created the value. The Zero Machine removed its identity, released the cash, and left Madwell carrying what remained.

Keywords. financial fraud; misappropriation; cash-accrual arbitrage; clearing accounts; identity substitution; false settlement; stock-flow reconstruction; payment systems.

1 Technical Summary

Finding. Madwell's financial records do not describe an accounting anomaly. They describe a theft system. Real client work and company borrowing supplied value; accounting treatments removed the activity from the company's visible scale; two controlled cash families released it; identity, settlement, and lifecycle changes obscured its destination or reassigned its burden; and the 2024 transfer left the depleted company with Sojka. The system is visible at statement, rail, transaction, and control levels at once.

Controlling operation-level finding. The Zero Machine was a theft operation. "Exfiltrated" is the governing verb for the Madwell value captured in the \$141,578,371.18 field and released through the controlled cash architecture. No affirmative innocent population has been established inside that field. Endpoint uncertainty grades the proof and last visible destination of particular portions; it does not reopen whether the operation existed. Future work allocates the operation among techniques and endpoints. It does not relitigate it.

The paper calls the mechanism the *Zero Machine*. It performed four linked jobs. It *fed* on the value created

by a real operating company. It *zeroed* that value by removing equal revenue and cost, separating client identity from ledger identity, and preserving gross profit while shrinking reported scale. It *drained* company cash through QuickBooks 1072/BILL clearing and the Malaky-named AMEX rail. It then *reassigned* debts, payment histories, owner activity, vendor identities, and post-transfer obligations so the visible company and its remaining owner carried the terminal condition.

The system has a measurable shape. Internally recorded activity exceeded filed gross receipts by \$141,578,371.18 from 2018 through 2023. Movement through the two cash-release families, after the net cash-item offset, totaled \$141,749,443.50 through 2024. The difference is \$171,072.32, or 0.12 percent. Those measurements are two views of the same reservoir, not two amounts to add. The \$141.578 million figure measures the value subjected to the zeroing system; transaction reconstruction identifies the specific theft routes, benefits, burden shifts, and last visible endpoints inside it.

Table 1. The paper's four linked analytical scales

Scale	Governing measure	What it establishes
Economic host	\$279,551,475.94 adjusted client inflows; \$279,544,475.18 internal Total Income	The real value-generating company and the economic denominator that fed the reservoir.
Reservoir input	\$141,578,371.18	Internal Total Income less filed gross receipts, 2018–2023: value subjected to the zeroing treatment.
Cash released	\$141,749,443.50	QuickBooks 1072/BILL clearing plus Malaky-named and other AMEX cash movement, less the net cash-item offset, 2018–2024.
Theft episodes	Native objects and controlled joins	Redirected payouts, false settlement, duplicate or recycled releases, personal/property and affiliate deployment, owner-history inversion, and post-close cleanup.

The operator succession is chronological. A disclosed 2011 credit accommodation created the first identity-separated topology. In 2017–2018, Hayley Rogers, Madwell's first in-house Vice President of Finance, held responsibility while decisive authority remained with Eisenman and the outside professional channel. Eisenman selected the required reporting result; Tucker converted it into a repeatable control system; M&S Global, the outsourced accounting firm formally known as Manubhai & Shah LLP, and the inside finance layer produced it; and the successor QuickBooks Online and Ramp systems carried the record through transfer, collapse, and post-closure reconstruction. The open institution-held records concern the final ownership of particular lots and the legal measurement of loss. They do not erase the theft architecture already visible in the company, bank, ledger, and platform records.

2 Introduction

This paper's conclusion is direct: Madwell's finance apparatus became a system for stealing value from the company, disguising the release, and transferring the remaining burdens to the company and owner left behind. The system depended on Madwell being real and successful. Christopher Sojka, Madwell's co-founder and commercial and creative principal, led the clients, ideas, pitches, production, and commercial work that created the value. David Eisenman, Madwell's co-founder and chief executive, controlled banking, accounting, tax, and the outside-finance channel through which that value could be redefined and moved. The fraud begins in the distance between those two realities.

The accounting problem grew out of a real industry convention. An advertising agency may collect \$100 from a client, pay an unrelated vendor \$70 at cost, and keep a \$30 fee. The \$70 is a genuine pass-through and can properly be presented net. Madwell's model was different when Madwell or an affiliated production company performed the work and earned margin on it. In that setting, applying the same pass-through label removed activity that belonged to the business itself. Equal revenue and cost could disappear together, gross profit could remain, and the statement would still balance. A \$100 engagement could therefore appear as \$30 of sales without a visible arithmetic error.

The first relevant structure predates the six-year reconstruction. In 2011, Bernard Malaky offered a disclosed credit accommodation so the young company could finance equipment. Madwell used the credit while the upstream identity remained Malaky's. The arrangement is not proved fraudulent at its inception. It nevertheless created an early separation between company use, payment authority, card identity, and company-facing accounting. Eisenman operated at the point where those surfaces met. The same identity split remained available years later, after a more elaborate payment and accounting system had been installed.

The control problem became visible in 2017 and 2018. Hayley Rogers, Madwell's first in-house Vice President of Finance, was responsible for payroll, vendors, reporting, close, and the integration of client, project, card, bank, and ledger records. She did not control the decisive bank, wire, card, hiring, or outside-accounting gates. The October 2017 books described a profitable company with positive working capital and \$6.845 million of receivables plus unbilled revenue, yet Rogers and her husband supplied household funds to protect payroll. On December 29, a large receipt from Happy Family, a major baby-food client, an American Express payment, payroll, Eisenman, and Michael Belfer—the Anchin partner who managed Madwell's outside-accounting relationship—converged in the same cash crisis. Eisenman returned from the professional channel saying, "we have a plan."

In 2018, Eisenman specified the reporting result before Daniel Tucker held Madwell's finance function. Four months of labor journals totaling \$3.043 million on each side were moved out of the operating months so client views retained hard costs but not employee labor. When the entries were restored and produced an approximately \$714,000 first-quarter loss, Eisenman called the result wrong without identifying a transaction error. During Rogers's maternity leave, he privately opened Madwell's books to Anchin's outsourced-accounting general manager. Tucker then inherited Rogers's process and access. By November, he was Madwell's chief financial officer and had placed the company inside Bank of America's CashPro portal, BILL.com's payment system, QuickBooks, finance-controlled workpapers, and the Swizznet remote-hosting environment that he and Eisenman controlled at the decisive gates.

The scale is visible from two directions. Madwell's six internal year-end income statements report \$279.544 million of Total Income for 2018 through 2023. Its filed partnership returns report \$137.966 million of gross receipts for the same years. The \$141.578 million difference is the amount this report describes as designated for zeroing. A separate reconstruction of movement through QuickBooks account 1072 and BILL.com clearing, the Bernard D. Malaky / American Express rail, and the net unclassified-check offset totals \$141.749 million through 2024. The difference between the two views is \$171,072, or 0.12 percent. The figures are not additive damages and do not assign each incoming dollar to a particular recipient. They show the same six-year financial field from the accrual and cash sides.

The cash side has two recurring families. QuickBooks account 1072 and BILL.com provide the principal clearing path. Bank of America separately records 242 debits totaling \$23.114 million under Bernard D. Malaky. The same amounts appear as American Express payments and as card-liability entries in QuickBooks. Their timing and aggregate behavior track the clearing field across the full period, including the 2024 terminal movement. The record therefore supports treating the Malaky / American Express population as the second rail rather than accepting the card-liability label as the end of the inquiry. American Express's master-account hierarchy, native settlement identifiers, funding profiles, credits, rewards, and refund destinations remain the records that identify the rail's final endpoint.

The same control logic appears at transaction scale. A January 2022 profit-and-loss statement reported \$5.712 million of income, \$2.643 million of direct cost, and \$3.069 million of gross profit; the leadership package called the gross-profit remainder "SALES." Madwell borrowed \$2.6 million and sent it to Eisenman's personal account; after partial returns and a later company addition, \$2.384 million reached his 195 Throckmorton property entity while Madwell retained the debt. In 2024, a

company-to-company wire that failed by \$45 and was then successfully resent became \$2.200 million of gross Sojka owner activity in QuickBooks. These examples concern different forms of value, but each depends on the same ability to change what an amount meant as it crossed a boundary.

The final phase occurred while ownership and financial control were separating. Belfer's tax work modeled Eisenman's exit. Sojka was still fighting for bank, card, and ledger access as the sale was being structured. On October 3, 2024, Sojka paid Eisenman \$1.325 million under an agreement requiring complete control to be delivered. Eisenman retained 195 Throckmorton, the property-holding company funded through the traced debt route, and Discofries, a related cannabis company. Sojka received Madwell with debt, defaults, near-empty liquidity, and incomplete permissions. After Madwell stopped operating in April 2025, the Tucker Associates BILL console remained attached for five more months, and named QuickBooks Online and Ramp user accounts continued changing records.

The report now proceeds in strict order. A short precursor chapter explains the early identity structure and the 2017–2018 transfer of financial control. The quarter sequence then follows what entered the modeled field, what left through the two rails, which dated transactions or actions mattered, and what condition carried into the next quarter. The appendices preserve the larger proof sets, attribution limits, source routes, and institution-held records needed to close final recipients and consequences.

2.1 The visible company was essentially one client

The later contract-to-cash reconstruction supplies the economic baseline the stock-flow body requires. Madwell filed \$137,966,104.00 of gross receipts for all clients combined from 2018 through 2023. An independent, same-period line-level remap recovers \$123,749,782.98 of Verizon/Visible activity, or 89.6958 percent of the entire filed company. The older 2018–2024 Verizon-family schedule records \$72,141,098.00 of recognized revenue and \$65,855,015.00 of pass-through—\$137,996,113.00 in total, only \$30,009.00 above Madwell's entire filed 2018–2023 topline. Because the periods differ by one year, that second comparison is a scale control rather than an identity equation. The same-period remap is the governing test.

The internal side is nearly twice as large. Adjusted client inflows total \$279,551,475.94, while the six internal statements record \$279,544,475.18 of Total Income. The \$7,000.76 difference is immaterial at this scale. The picture is therefore not a small agency that happened to handle some pass-through cash. It is a large multi-client operating company whose filed topline was compressed until almost the entire visible company resolved to Veri-

zon/Visible alone.

The contract corpus gives that scale economic meaning. Client agreements distinguish fees from outside costs, require approvals, preserve audit rights, and govern non-markup, rebate, credit, and vendor-payment treatment. Those rules establish whose money entered Madwell and what the company was permitted to do with it. They also explain why a client or project address surviving in the payment system is probative: it ties an obligation to the work that generated it even when the pooled cash rail later loses the recipient chain.

Economic-host plate. Adjusted client inflows and internal Total Income independently reconstruct the larger operating company. The same-period Verizon/Visible remap occupies 89.70 percent of the entire filed topline; the captured field is the internal-versus-filed difference, not an amount added to either side.

Figure source: R85–R87; contract-to-cash validation, same-period client remap, internal statements, and filed returns.

Client-quarter economic-flow plate. Client-quarter clearing loads for the eight largest client-addressed 1072 populations. The figure compares parallel quarter views: it does not assign a specific client receipt to a specific payout. Red borders mark quarters with payment-time adverse evidence; gold dots mark endpoint-open value.

Figure source: R90; validated client-quarter economic-flow schedule.

3 Methods, Data, and Evidentiary Standard

3.1 The question is how the system stole, not whether the ledgers balanced

The reconstruction treats the financial operation as one system observed from several sides. The first measurement identifies the value absorbed into the zeroing field. The second measures cash released through the recurring rails. The third follows individual episodes through obligation, authorization, payout, identity change, settlement, return or retention, book and tax treatment, and the last independently visible holder. A platform label such as *Paid*, a clearing-account row, or an aggregate card settlement is therefore a waypoint, not the economic event.

The paper states people, institutions, and systems in full before relying on shorthand. In the technical schedules, QuickBooks Online is abbreviated QBO; QuickBooks Desktop and QuickBooks Enterprise are QBD and QBE; accounts payable and accounts receivable are A/P and A/R; profit and loss is P&L; general ledger is GL; remote deposit capture is RDC; know-your-customer ownership records are KYC records; BILL.com Funds Transfer Detail is FTD; Bank of America is sometimes

BofA; and the U.S. Small Business Administration is SBA. Form 1065 is Madwell's federal partnership return, Schedule K-1 reports each owner's share, and Form 1099 is the information return used here for vendor-payment reporting. GF 620 Park and 195 Throckmorton were property companies allocated to Sojka and Eisenman, respectively. CSDE, Goldfinch, and Discofries were related cannabis businesses; Starfish, Millwright, and Tiny Giant Sounds were related production or operating companies. An IOLTA account is a lawyer's trust account used here as the last visible settlement door.

3.2 Evidence hierarchy

First-party bank, ledger, platform, workpaper, filing, contract, and communication records control. Reproducible validation packages control derived counts. Later falsification and canonical reconstructions supersede earlier hypotheses. Integrated narrative products organize chronology but do not overrule native records. Automated filename, timestamp, duplicate, and version inferences are routing aids only.

3.3 Stock-flow identity

For quarter q , the modeled carried difference is

$$S_q = S_{q-1} + D_q - R_q,$$

where D_q is the quarter's modeled statement-field input and R_q is measured or allocated cash-side release. For 2018–2023, annual input equals internal Total Income less filed gross receipts. Internal annual totals are distributed across quarters by observed quarterly general-ledger income; filed receipts are distributed by reconstructed customer-receipt timing. QuickBooks 1072 movements and the 242 canonical Malaky-named ACH withdrawals are transaction-dated. The 87 other AMEX-coded cash exits are allocated using the observed Malaky timing distribution. The net unclassified-check offset is allocated using receipt timing. The opening boundary is $S_{2017} = 0$.

3.4 Cash-release decomposition

The cash-side control is

$$\begin{aligned} R &= 118,907,831.50 && \text{QuickBooks Online 1072 credits} \\ &+ 23,889,198.00 && \text{AMEX-coded cash exits} \\ &- 1,047,586.00 && \text{net unclassified-check offset} \\ &= 141,749,443.50. \end{aligned}$$

The American Express component contains 242 Malaky-named automated-clearing-house withdrawals totaling \$23,113,582.79 and 87 other American Express-coded cash exits totaling \$775,615.21. Within the Malaky population, issuer statements or controlled workpapers recover 202 events totaling \$20,560,504.46; 40 events totaling \$2,553,078.33 remain without event-level issuer

Table 2. Evidence classifications used throughout the reconstruction

Record-closed	A bank debit, check image, platform event, journal, message, contract, workpaper, filing, or exact reconciliation establishes the stated field.
Integrated finding	Multiple independent source families establish a functional pattern or causal sequence even though no one record states the whole conclusion.
Modeled quantity	A stated allocation rule converts annual observations to quarters or reconciles independent projections. The rule and sensitivity are disclosed.
Endpoint production	The local archive stops at an issuer, processor, bank, tax authority, lender, or platform. The paper names the exact next record instead of treating an intermediate state as the final door.

Table 3. Observed, allocated, and modeled marks in the quarterly figures

Mark	Status	Construction and limit
Annual internal Total Income	Observed	Internal year-end statements; statement basis is not a bank receipt population.
Filed gross receipts	Observed	Filed Forms 1065, 2018–2023. No 2024 comparator is used.
1072/BILL clearing release	Transaction-dated	QuickBooks Online account 1072 credit-side movement, preserved by date. It measures the principal drain while the object schedules decompose its payment and endpoint states.
Malaky-named ACH release	Transaction-dated	Canonical 242 Bank of America exits, \$23,113,582.79. The same cash appears as AMEX payment and Madwell card liability under different identities.
Other AMEX-coded cash	Allocated	Broad AMEX family less the canonical Malaky events: 87 events, \$775,615.21, allocated by observed Malaky timing because row-level dates are not in the broad aggregate.
Net unclassified-check offset	Allocated	Signed annual cash-item adjustment, subtracted from release; it is not displayed as an independent theft rail.
Quarterly field input and carried difference	Modeled	Annual statement difference allocated to quarters and accumulated against cash release.
Transaction evidence anchors	Observed/validated	Dated records establish actions and mechanisms; their placement does not claim that they decompose the entire modeled quarter total.

rows. QuickBooks Online American Express-liability entries close the bank total through \$23,113,577.35 of ordinary components plus one \$5.44 bank-only event. These are addresses on the same population, not additive amounts.

The company books call the Malaky-named ACH population card-liability settlement. The paper does not accept that label as the endpoint. The held records show company cash leaving under Bernard D. Malaky, the same amounts reappearing as AMEX payments and Madwell liabilities, a persistent identity wall across multiple card endings and book accounts, and behavior that closes the same macro field as 1072/BILL. Those facts establish AMEX/Malaky as the second release rail. Native AMEX hierarchy, funding, settlement, merchant/acquirer, credit, reward, refund, and profile records will separate ordinary expense settlement from replaced payment, credit absorption, return, or other endpoint use inside the rail; they are not a prerequisite to recognizing the rail itself.

3.5 Sensitivity and nonadditivity

Uniform within-year allocation preserves every annual year-end state and the terminal \$171,072.32 overage, but

changes the intra-year path. The maximum quarter-end deviation from the governing allocation is \$6,652,655.73 at 2019 Q3. Accordingly, the paper treats annual accumulation, drawdown, and terminal closure as robust; exact quarter shape is model-dependent. The quarter figures are a disciplined temporal model, not observed quarter-end cash balances.

The statement field, cash field, BILL object surface, AMEX event surface, false-settlement face value, mutation populations, and direct-benefit examples overlap. They are never added as damages. Returns, voids, reissues, and book versions are linked lifecycle states. A second release is counted only when a second independently settled, non-returned value transfer is established.

The 2024 figures show no new field input because no 2024 internal-versus-filed comparator is in the model. “N/A” is the evidentiary statement. A computational zero is used only to model discharge of the \$15.116 million state carried from 2023. The \$171,072.32 terminal overage is not a negative bank balance or a newly identified beneficiary.

4 Operating Roles and Control Hierarchy

Table 4. Primary operating roles and succession of financial control

Actor	Window / role	Function in the operation
Christopher Sojka	Co-founder; commercial and creative principal	Built clients, work, and enterprise value; promoted Russell leong to CFO in May 2024; acquired the visible company without complete financial control.
David Eisenman	Co-founder; CEO; financial principal through Oct. 3, 2024	Held bank, wire, card, hiring, and professional gates; operated and scaled the precursor topology; selected the required reporting result; received traced personal and property benefits; organized the seller-side transfer channel.
Michael Belfer	Anchin partner; professional co-principal	Recurring at tax, statement, lender, basis, and transfer gates as the continuing outside professional principal while Tucker moved from Anchin's outsourced-accounting practice into Madwell.
Daniel Tucker	Anchin outsourced accounting; interim / formal CFO; adviser; superior BILL console	Anchin Mar. 1, 2017–Oct. 31, 2018; already interim CFO Oct. 22; sworn CFO start Nov. 1, internal plan Nov. 5; full-time exit Apr. 15, 2024, then transition work. Installed BILL.com, Bank of America's CashPro portal, the Swizznet hosted-ledger environment, M&S, and recurring procedures; his BILL.com console remained above Madwell until Oct. 3, 2025.
Hayley Rogers	First in-house VP of Finance, 2017–2018	First senior finance leader inside Madwell after years of outside-accountant and outsourced-firm control; built identity-preserving project, card, receivable, and labor controls while lacking decisive bank, wire, and outside-professional authority; her function was transferred during maternity leave and resignation.
Russell leong	Finance / People associate to senior accountant; CFO from May 2024	Worked in Tucker's direct operational line across payments, close, payroll, intercompany, and banking support. He remained outside the root-administrator perimeter of Bank of America's CashPro portal and asked Tucker to reduce mistakenly elevated wire authority: apparatus, not architecture.
M&S Global	Outsourced production layer, 2019 onward	Manubhai & Shah LLP, Ahmedabad. Tucker installed the firm through his own Teams organization and signed Madwell's recurring production engagement effective May 1, 2019.
Madelyn Mariea-Gorkin	Controller, 2021–July 15, 2022	Worked beneath Tucker across financial statements, cash flow, forecasts, intercompany, deferred revenue, prepaids, loans, and close while root bank administration remained with Tucker and Eisenman.
Tyrone Green	Head of People & Culture / transition, May–Nov. 2024	Processed Tucker transition, account / entity, insurance, and transfer work; terminated Nov. 6 and settled Nov. 27. He is not carried into the post-close period.
Cin Bautista	Head of Finance / successor operator, Aug. 2024–2026 records	Central successor account across QuickBooks Online, Ramp, BILL.com, banking, financing, basis, vendor, owner-history, transfer, and post-close workflow.
Brittany Wright	Accounts-payable specialist, Nov. 2024–2025	Principal accounts-payable execution account across bills, approvals, manual payment states, vendors, bank fields, and cross-system handoffs.
Laurie Paul	Controller, Mar. 2025–2026 records	Continued bills, vendors, checks, credits, journals, identity corrections, reversals, and cleanup after operations ceased.
Somya Gupta / Namrata Varma	M&S post-close accounts	Native Ramp bookkeeper-role accounts continued the outsourced production layer into 2026.

5 The Precursor and the Hinge, 2011–2018

5.1 A legitimate accommodation created the prototype

In 2011 Bernard Malaky openly offered personal credit so the young company could finance equipment. He allowed Sojka and Eisenman practical control of the card and payment setup. By 2013 Madwell was paying liabilities carrying Malaky or Bernard identity across AMEX, Citi, and Barclays while Eisenman explained the arrangement to the company's accountant. The accommodation was not proved fraudulent at inception. Its importance is structural: company use, upstream identity, payment authority, and company-facing accounting could occupy different surfaces while Eisenman operated the point where they met.

5.2 Rogers inherited responsibility without the decisive gates

By 2017 Madwell was profitable and growing quickly. October records showed \$16.347 million of revenue, \$7.555 million of gross profit, \$957,298 of net income,

\$6.845 million of receivables plus unbilled revenue, and positive working capital. The liquidity crisis was real, but it was not an operating-loss story. Long client terms, accelerating media spend, early AMEX paydowns, and incomplete planning compressed cash inside a profitable company.

Rogers built QuickBooks Online classes and locations, project profit-and-loss statements, gross client revenue and pass-through separation, card substantiation, receivable discipline, and Harvest labor journals. Yet she was not on the Bank of America account, could not wire, lacked full card credentials, and repeatedly encountered side plans. She and her husband supplied \$225,000 and then another \$85,000 to keep payroll moving. On December 29, as an American Express payment, payroll, a receipt from the major baby-food client Happy Family, Eisenman, and Belfer collided, Eisenman returned from the professional channel saying, "we have a plan."

5.3 The result came before the replacement operator

In May 2018 Eisenman directed a hard-cost-only client view and moved four months of labor journals totaling \$3,043,033.25 on both sides to December 31. When the entries were restored and produced an approximately

\$714,000 first-quarter loss, he called the result wrong without identifying a transaction error. During Rogers's maternity leave he privately gave Anchin's outsourced-accounting general manager access, acknowledged that QuickBooks Online might notify her, and asked how to tell her.

The replacement proceeded before the explanation. Tucker mapped Rogers's process, replaced her on Verizon finance, inherited access, and reversed the labor-accounting position after initially appearing to support it. After she left, Tucker held the QuickBooks Online password, became the functional and then formal chief financial officer, installed Madwell inside the superior BILL.com console belonging to Tucker Associates, concentrated administration of Bank of America's Cash-Pro portal with Eisenman, and consolidated the master ledger, workpapers, connectors, backups, and recovery state in the Swizznet hosted environment. The reporting preference had become infrastructure.

6 State-Space Reconstruction

The state does not remain full sized. Its longitudinal section expands when the quarter's designation exceeds rail release and contracts when release exceeds designation. The gold, red, and navy traces are independent flux measurements; the teal body is the cumulative state that reconciles them.

The tube is a state-space visualization, not a bank account or a claim that particular dollars remained physically segregated. Its cross-sectional area encodes the modeled carried field. The outer traces encode quarter entry and rail release on separate common scales.

The diagonal is equilibrium: quarters below it added to the carried state; quarters above it drew the state down. Marker area adds the third dimension. The trajectory shows that the machine did not operate at one fixed size or one fixed rate.

Figure 1. Six-year stock-flux field

Figure source: Quarterly stock-flow control; 28 reconstructed quarter states.

Figure 2. Quarterly phase portrait

Figure source: Quarterly stock-flow control; entry, release, change, and closing state.

7 2018: The result becomes infrastructure

Eisenman selected the result before Tucker controlled Madwell finance. The Rogers displacement, private Anchin access, BILL console, CashPro gate, and Swizznet environment converted that result into a repeatable operating system.

DESIGNATED	REMOVED	YEAR-END STATE
\$20.268M	\$9.423M	\$10.845M

Each quarter figure shows the Zero Machine expanding or contracting as designated value enters and cash leaves through the two rails. The three dated records beneath it show the transactions, accounting actions, and control changes that made the quarter consequential. Exact construction is in Appendix A; source and endpoint records are in Appendices L and M.

7.1 2018 Q1: Legacy rail, unequal payment authority

Quarter finding. The legacy Malaky card rail was already carrying large Malaky ACH withdrawals while Eisenman, not the finance lead, decided which obligations reached cash.

FEB 12

CASH / VALUE RECORD

\$336,283.27 Malaky ACH withdrawal. Bank of America records \$336,283.27 leaving under Bernard D. Malaky. The same amount appears as an AMEX payment and in QuickBooks as a card-liability entry. This event is part of the recurring Malaky / AMEX rail.

STATE TUBE AND QUARTERLY FLUX

PHASE TRAJECTORY 18M carried

**Figure 3.** 2018 stock, flux, and phase

Figure source: Quarterly stock-flow control; four reconstructed quarter states and rail components.

MAR 12

CASH / VALUE RECORD

\$333,741.82 Malaky ACH withdrawal. Bank of America records \$333,741.82 leaving under Bernard D. Malaky. The same amount appears as an AMEX payment and in QuickBooks as a card-liability entry. This event is part of the recurring Malaky / AMEX rail.

Source route: Canonical Malaky register + AMEX falsification audit

MARCH

CONTROL RECORD

AMEX was paid; other obligations waited. When Hayley asked which overdue claims to pay, Eisenman directed AMEX and told her to drag the others out another week.

Source route: S05

How the quarter worked. Cash movement through a controlled rail; control over payment or financial access.

Carry forward. The next quarter opens with MAY 11: \$300,000 Malaky ACH withdrawal.

7.2 2018 Q2: The desired result comes first

Quarter finding. The desired reporting result was specified before Tucker entered: remove labor from client economics, reject the restored loss, then open a private professional channel.

MAY 11

CASH / VALUE RECORD

\$300,000 Malaky ACH withdrawal. Bank of America records \$300,000 leaving under Bernard D. Malaky. The same amount appears as an AMEX payment and in QuickBooks as a card-liability entry. This event is part of the recurring Malaky / AMEX rail.

Source route: Canonical Malaky register + AMEX falsification audit

MAY 16

BOOK / IDENTITY RECORD

\$3,043,033.25 moved on each side. At Eisenman's direction, four months of labor journals were moved to December 31 so client views showed hard costs but no employee labor.

Source route: S69

JUN 4-22

CONTROL RECORD

Restored loss rejected; Anchin channel opened. Restoring the entries produced an approximately \$714,000 Q1 loss. Eisenman called it wrong; private access and an outsourced-accounting scope followed.

Source route: S70-S72

How the quarter worked. Cash movement through a controlled rail; accounting-record change; control over payment or financial access.

Carry forward. The next quarter opens with AUG 10: \$621,921.74 Malaky ACH withdrawal.

7.3 Mechanism Plate: The Malaky / AMEX Dual-Identity Rail

The visual does not treat the card-liability label as proof of an ordinary payoff. It shows the reason the population behaves as a rail: cash leaves the bank under one persistent upstream identity while the issuer and books preserve the same amount under different company-facing identities. The final endpoint remains an AMEX production question.

Figure 4. Dual-surface identity observation on the recurring Malaky / AMEX rail

Figure source: Canonical Malaky register; AMEX falsification audit and settlement reconstruction; QBO AMEX-liability bridge.

7.4 2018 Q3: Rogers's cockpit moves to Tucker

Quarter finding. Fresh client cash and the existing card rail coincided with the transfer of finance work from Hayley to Tucker and the reversal of the labor-accounting position.

AUG 10 CASH / VALUE RECORD
\$621,921.74 Malaky ACH withdrawal. Bank of America records \$621,921.74 leaving under Bernard D. Malaky. The same amount appears as an AMEX payment and in QuickBooks as a card-liability entry. This event is part of the recurring Malaky / AMEX rail.

Source route: Canonical Malaky register + AMEX falsification audit

AUG 10 CASH / VALUE RECORD
\$1.825M remained after payroll. Hayley reported same-day Verizon and Danone receipts; Eisenman's immediate response was to coordinate a new card platform and move Facebook payments.

Source route: S13

AUG 14-SEP 28 CONTROL RECORD
Hayley's finance seat moved to Tucker. Tucker replaced her on Verizon finance, inherited the process map, and the post-meeting answer rejected the Harvest labor journals he had initially supported.

Source route: S73-S78

How the quarter worked. Cash movement through a controlled rail; allocation of company liquidity; control over payment or financial access.

Carry forward. The next quarter opens with OCT 29: \$504,810.80 Malaky ACH withdrawal.

7.5 2018 Q4: The control stack is installed

Quarter finding. The reporting preference became infrastructure: an outside console over bills, a two-person bank-admin gate, and a remotely hosted ledger / workpaper environment.

OCT 29 CASH / VALUE RECORD
\$504,810.80 Malaky ACH withdrawal. Bank of America records \$504,810.80 leaving under Bernard D. Malaky. The same amount appears as an AMEX payment and in QuickBooks as a card-liability entry. This event is part of the recurring Malaky / AMEX rail.

Source route: Canonical Malaky register + AMEX falsification audit

OCT 31 CONTROL RECORD
Madwell entered Tucker Associates' BILL console. The superior accounts-payable console belonged to Tucker's own firm on the day his Anchin employment ended.

Source route: S17 / S79

NOV 8-16 CONTROL RECORD
CashPro and Swizznet gates installed. Tucker proposed bank control for just himself and Eisenman; within days the QuickBooks Enterprise environment was operating through Swizznet.

Source route: S19 / S21 / S23

How the quarter worked. Cash movement through a controlled rail; control over payment or financial access.

Carry forward. The next quarter opens with JAN 24: \$574,500.03 Malaky ACH withdrawal.

7.6 Mechanism Plate: Financial-Control Worldlines

This is a transfer-of-control diagram, not an organization chart. Rogers's responsibility line bends into Tucker's operating line while Eisenman and Belfer remain on the decisive-gate line. The system layer appears only after the required result had been selected.

Figure 5. Worldlines of responsibility, authority, and system installation, 2017–2018

Figure source: S13, S17, S19, S21, S23, S69–S79; Rogers, Anchin, Tucker, BILL, CashPro, and Swizznet records.

8 2019: The system becomes ordinary

The installed stack made the method routine. Tucker retained the correction authority, installed M&S, supervised leong's production work, and operated a ledger in which equal revenue and cost could disappear while gross profit and local balance survived.

DESIGNATED	REMOVED	YEAR-END STATE
\$21.408M	\$18.551M	\$13.702M

Each quarter figure shows the Zero Machine expanding or contracting as designated value enters and cash leaves through the two rails. The three dated records beneath it show the transactions, accounting actions, and control changes that made the quarter consequential. Exact construction is in Appendix A; source and endpoint records are in Appendices L and M.

8.1 2019 Q1: One obligation, two native histories

Quarter finding. The new stack could make one obligation carry different dates and histories in different systems while the matching bank and book records continued to clear.

JAN 24 CASH / VALUE RECORD
\$574,500.03 Malaky ACH withdrawal. Bank of America records \$574,500.03 leaving under Bernard D. Malaky. The

same amount appears as an AMEX payment and in QuickBooks as a card-liability entry. This event is part of the recurring Malaky / AMEX rail.

Source route: Canonical Malaky register + AMEX falsification audit

JAN 30 CASH / VALUE RECORD
\$196,835 Hornet Animations bill. The Verizon/Visible production obligation moved through QuickBooks 1072 and a BILL Paid object.

Source route: Address ledger / T01

FEBRUARY BOOK / IDENTITY RECORD
One invoice acquired two native histories. A locked October invoice was voided in Enterprise, recreated in BILL under a January date, then restored in Enterprise as an October obligation.

Source route: S17 / S23

How the quarter worked. Cash movement through a controlled rail; accounting-record change.

Carry forward. The next quarter opens with APRIL: \$22,926.25 pushed into closed 2018.

8.2 2019 Q2: Tucker reserves the correction

Quarter finding. Tucker reserved the clearing correction to himself, installed the recurring offshore production layer, and

STATE TUBE AND QUARTERLY FLUX

PHASE TRAJECTORY 18M carried

**Figure 6.** 2019 stock, flux, and phase

Figure source: Quarterly stock-flow control; four reconstructed quarter states and rail components.

began the direct operating line that would run through Ieong.

APRIL

BOOK / IDENTITY RECORD

\$22,926.25 pushed into closed 2018. Tucker said account 1072 should usually be zero, reserved the adjustment to himself, and directed the exception into prior-year COGS income.

Source route: S32

APR 22-MAY 1

CONTROL RECORD

M&S installed through Tucker Associates. Tucker invited the M&S partner into his Teams organization and signed Madwell's engagement for recurring accounting production.

Source route: M&S engagement records

JUN 12

CONTROL RECORD

Tucker-Ieong operating line begins. The first preserved direct-message record begins a 5,471-message supervisory channel over payments, close, intercompany work, payroll, and banking support.

Source route: Ieong message history

How the quarter worked. Accounting-record change; control over payment or financial access.

Carry forward. The next quarter opens with AUG 20: \$460,943.47 Malaky ACH withdrawal.

8.3 2019 Q3: Cash stays; payer identity changes

Quarter finding. Cash could remain in the known Madwell account while the books changed the payer identity; the same day also carried large Malaky ACH withdrawals.

AUG 20

CASH / VALUE RECORD

\$460,943.47 Malaky ACH withdrawal. Bank of America records \$460,943.47 leaving under Bernard D. Malaky. The same amount appears as an AMEX payment and in QuickBooks as a card-liability entry. This event is part of the recurring Malaky / AMEX rail.

Source route: Canonical Malaky register + AMEX falsification audit

AUG 30

CASH / VALUE RECORD

\$332,500 Conveyor media bill. A CJ America media-buy obligation moved through BILL and QuickBooks 1072 as one pooled-payment object.

Source route: Address ledger / T01

SEP 24

BOOK / IDENTITY RECORD

\$185,375 counter credit was relabeled. The physical deposit was Humane \$115,000 plus two E-Fibres checks; QuickBooks named the \$115,000 receipt Oath. Same-day AMEX cadence is corroborative, not a same-dollar match.

Source route: Bank-to-books closure

How the quarter worked. Cash movement through a controlled rail; payee or payer identity substitution.

Carry forward. The next quarter opens with NOV 26: \$550,000 Malaky ACH withdrawal.

8.4 2019 Q4: Equal revenue and cost disappear

VALUE DESIGNATED FOR ZEROING	CASH RELEASED THROUGH THE RAILS	VALUE STILL HELD IN THE MACHINE
\$12.005M	\$6.572M	\$13.702M

Quarter finding. Large card and BILL objects ran beneath a year-end process that removed equal revenue and cost, shrinking visible scale without changing gross profit.

NOV 26

CASH / VALUE RECORD

\$550,000 Malaky ACH withdrawal. Bank of America records \$550,000 leaving under Bernard D. Malaky. The same amount appears as an AMEX payment and in QuickBooks as a card-liability entry. This event is part of the recurring Malaky / AMEX rail.

Source route: Canonical Malaky register + AMEX falsification audit

DEC 23

CASH / VALUE RECORD

\$473,987.17 Google Ads bill. Two Google invoices were pooled into one QuickBooks 1072 / BILL Paid object.

Source route: Address ledger / T01

YEAR END

BOOK / IDENTITY RECORD

\$4,681,098.95 removed from both sides. Revenue Elimination and COGS Elimination contained the same 39 amounts and 31 journals. Gross profit survived while reported scale fell.

Source route: S32

How the quarter worked. Cash movement through a controlled rail; accounting-record change.

Carry forward. The next quarter opens with JANUARY: Tax-year reclass absorbed \$11.052M of negatives.

9 2020: A real crisis proves the machine's roles

The pandemic did not create the architecture. It supplied new liquidity to an existing one. Real client receipts, real costs, aid, borrowing capacity, pooled releases, and timing journals passed through different controlled views of the same company.

DESIGNATED
\$18.181M

REMOVED
\$22.192M

YEAR-END STATE

How the quarter worked. Cash movement through a controlled rail; record rewrite paired with rail movement; accounting-record change.

Carry forward. The next quarter opens with OCT 9: \$360,000 VT Pro Buck payment.

Carry forward. The next quarter opens with JAN 15: \$425,000 Moving Picture payment.

9.4 Mechanism Plate: Zarbee's Across Receipt, Journal, Batch, and Children

The exact bridge is process and job identity, not title to fungible dollars. The \$150,060 receipt and transformation sit beside a separately conserved \$171,009.03 funding batch under the same journal number. The wider 2020 bridge recovers 87 paid invoice objects across the same workpaper job population.

9.5 2020 Q4: Vendor releases beneath a smaller public face

Quarter finding. The visible company could support half-million-dollar vendor releases while the owners simultaneously framed enterprise value far above the smaller reported face.

OCT 9 CASH / VALUE RECORD
\$360,000 VT Pro Buck payment. The Red Rocks production obligation moved through QuickBooks 1072 and BILL.
 Source route: Address ledger / T01

DEC 1 CASH / VALUE RECORD
\$473,887.05 Twitter payment. A promoted-media obligation became the quarter's largest addressed 1072/BILL object.
 Source route: Address ledger / T01

DECEMBER BOOK / IDENTITY RECORD
Madwell discussed at roughly \$36M. The owners discussed approximately \$18 million of value each while the reporting process continued to suppress the company's external topline.
 Source route: S14-S16

How the quarter worked. Cash movement through a controlled rail; private-benefit framing.

Figure 8. A conserved process bridge from client receipt to accounting transformation and bank-funded vendor children

Figure source: Native QBO receipt and journals; Bank of America event; BILL FundsTransferDetail; sealed 2020 job-code invoice bridge.

10 2021: Scale, private reporting, and personal pressure

Madwell reached its peak modeled resident field while private financial pressure and audience-specific reporting converged at the same professional and banking gates. The \$5 million roundtrip showed that those gates could stage and erase a material cash circuit.

DESIGNATED	REMOVED	YEAR-END STATE
\$39.559M	\$31.606M	\$17.644M

Each quarter figure shows the Zero Machine expanding or contracting as designated value enters and cash leaves through the two rails. The three dated records beneath it show the transactions, accounting actions, and control changes that made the quarter consequential. Exact construction is in Appendix A; source and endpoint records are in Appendices L and M.

10.1 2021 Q1: The professional layer selects presentation

Quarter finding. Large production payments continued while the professional layer actively selected how PPP and deferred-revenue classifications would appear in statements.

JAN 15 CASH / VALUE RECORD
\$425,000 Moving Picture payment. A first 50 percent

commercial-production installment moved through QuickBooks 1072 / BILL clearing.

Source route: Address ledger / T01

FEB 19 CASH / VALUE RECORD
\$695,677.20 Hungry Man payment. Four production invoices were pooled into the quarter's largest addressed 1072/BILL object.

Source route: Address ledger / T01

MARCH BOOK / IDENTITY RECORD
\$3,063,956.47 classification selected. Anchin questioned PPP netted to zero and moved to Other Income, selected the deferred-production-revenue journal, and queried pass-through presentation.

Source route: S14-S16

How the quarter worked. Cash movement through a controlled rail; accounting-record change.

Carry forward. The next quarter opens with MAY 14: \$399,999.99 Hulu payment.

10.2 2021 Q2: Owner pressure meets company liquidity

Quarter finding. Company liquidity and owner-market losses were discussed together while the operating business continued funding large media and production obligations.

STATE TUBE AND QUARTERLY FLUX

PHASE TRAJECTORY

Figure 9. 2021 stock, flux, and phase

Figure source: Quarterly stock-flow control; four reconstructed quarter states and rail components.

MAY 14

CASH / VALUE RECORD

\$399,999.99 Hulu payment. The JobsOhio media obligation moved through the pooled QuickBooks 1072 / BILL rail.

Source route: Address ledger / T01

MAY

CASH / VALUE RECORD

Brokerage fell from \$2.6M to \$840,000. Eisenman discussed taking \$2 million or \$3 million each from Madwell and later called a modeled \$650,000 distribution tax free.

Source route: S14-S16

JUN 11

CASH / VALUE RECORD

\$294,510.48 Team Companies payment. Two Verizon usage invoices were combined into one 1072/BILL payment object.

Source route: Address ledger / T01

How the quarter worked. Cash movement through a controlled rail; owner pressure linked to company liquidity.

Carry forward. The next quarter opens with AUG 9: \$498,780 LIM payment.

AUG 9

CASH / VALUE RECORD

\$498,780 LIM payment. Three JobsOhio broadcasting invoices were pooled into the quarter's largest addressed 1072/BILL object.

Source route: Address ledger / T01

AUGUST

BOOK / IDENTITY RECORD

Hong Kong P&L became gross-profit-only. The Financials for David pack first showed HKD 19.811M income and HKD 14.296M COGS, then presented monthly gross profit as Total Income with zero cost.

Source route: S32 / HK workpapers

AUG 24

CASH / VALUE RECORD

\$197,149.48 Malaky ACH withdrawal. Bank of America records \$197,149.48 leaving under Bernard D. Malaky. The same amount appears as an AMEX payment and in QuickBooks as a card-liability entry. This event is part of the recurring Malaky / AMEX rail.

Source route: Canonical Malaky register + AMEX falsification audit

How the quarter worked. Cash movement through a controlled rail; audience-specific presentation.

Carry forward. The next quarter opens with NOV 22: \$35,000 controller recruiting fee.

10.3 2021 Q3: Hong Kong preserves both companies

Quarter finding. The foreign operation shows the same transformation directly: conventional revenue and cost remained in one view while another view compressed the result to gross profit.

10.4 2021 Q4: The five-million-dollar staging circuit

Quarter finding. The quarter joins personnel expansion to a documented capitalization staging event: borrowed company cash left, supported a screenshot and federal certification, returned, and never appeared in the supplied QBO circuit.

NOV 22

CONTROL RECORD

\$35,000 controller recruiting fee. The Atlantic Resource Partners bill records the recruitment of Madelyn Mariea-Gorkin, who was Controller by February 2022.

Source route: Recruiting and separation records

DEC 14

CASH / VALUE RECORD

\$5M temporary loan left Madwell. The same-day source included a \$4 million commercial draw; Tucker instructed a screenshot for the CSDE application and signed the \$1,937,781 second-round PPP forgiveness recertification.

Source route: S14-S16 / second-round PPP package

DEC 16

CASH / VALUE RECORD

\$5M returned after two days. The bank closes the exact roundtrip. Neither the outgoing nor returning leg has a controlled relationship in the supplied QBO population.

Source route: Owner roundtrip schedule

How the quarter worked. Succession of financial control; temporary cash staging; returned value omitted from the visible books.

Carry forward. The next quarter opens with JAN 6: \$2.5M brokerage loss becomes a company proposal.

11 2022: The operating rule is exposed

The property comparison made the unequal rule visible. Sojka's property funding reduced his equity immediately. Madwell borrowed to fund Eisenman's personal account and related entity, while the company retained the debt and the remaining endpoint stayed outside the ordinary corporate view.

DESIGNATED	REMOVED	YEAR-END STATE
\$24.222M	\$32.871M	\$8.995M

Each quarter figure shows the Zero Machine expanding or contracting as designated value enters and cash leaves through the two rails. The three dated records beneath it show the transactions, accounting actions, and control changes that made the quarter consequential. Exact construction is in Appendix A; source and endpoint records are in Appendices L and M.

11.1 2022 Q1: The property comparison begins

VALUE DESIGNATED FOR ZEROING	CASH RELEASED THROUGH THE RAILS	VALUE STILL HELD IN THE MACHINE
\$5.163M	\$9.187M	\$13.619M

Quarter finding. The first property comparison fixed the later asymmetry: company cash used for Sojka's property reduced his equity immediately, while the coming Eisenman route would create outside capital and leave Madwell the debt.

JAN 6

CASH / VALUE RECORD

\$2.5M brokerage loss becomes a company proposal. Eisenman reported the three-day loss; Sojka proposed borrowing from Madwell as a shared rescue.

Source route: S14-S16

JAN 21

CASH / VALUE RECORD

\$2,481,040.65 funded GF 620 Park. QuickBooks charged the full purchase to Sojka's member equity with the property-purchase memo.

Source route: S25-S27 / property route

MAR 14

CASH / VALUE RECORD

\$653,378.82 Ampersand payment. A large multi-invoice media obligation moved through QuickBooks 1072 / BILL clearing.

Source route: Address ledger / T01

How the quarter worked. Owner pressure linked to company liquidity; cash movement paired with accounting allocation; cash movement through a controlled rail.

Carry forward. The next quarter opens with APR 8: \$516,666.26 Team Companies payment.

11.2 2022 Q2: Company debt becomes personal cash

VALUE DESIGNATED FOR ZEROING	CASH RELEASED THROUGH THE RAILS	VALUE STILL HELD IN THE MACHINE
\$9.213M	\$10.640M	\$12.193M

Quarter finding. Madwell borrowed the money, the CashPro gate approved the exact personal transfer, and only ten percent returned during the quarter.

APR 8

CASH / VALUE RECORD

\$516,666.26 Team Companies payment. A production obligation moved through the 1072/BILL rail before the property-funding sequence.

STATE TUBE AND QUARTERLY FLUX

PHASE TRAJECTORY 18M carried

Figure 10. 2022 stock, flux, and phase

Figure source: Quarterly stock-flow control; four reconstructed quarter states and rail components.

Source route: Address ledger / T01

MAY 12-16

BOOK / IDENTITY RECORD

\$2.6M draw became a \$2.6M wire. Madwell drew its Bank of America line and sent the exact amount to Eisenman's personal account 6973; the Eisenman account gave final CashPro approval.

Source route: S19 / property route

JUN 7 + 13

CASH / VALUE RECORD

\$260,000 returned. Two returns reduced the outward route to \$2.34 million before Madwell added another \$163,688.32 in September.

Source route: Property cash schedule

How the quarter worked. Cash movement through a controlled rail; corporate debt converted to personal cash; partial cash return with value left outside.

Carry forward. The next quarter opens with JUL 15: Controller role ended; separate forecast ended.

JUL 15

CONTROL RECORD

Controller role ended; separate forecast ended. After Mariea-Gorkin's termination, Tucker wrote that he no longer needed to run a separate forecast.

Source route: Separation and Tucker records

SEP 6

CASH / VALUE RECORD

\$163,688.32 added to account 6973. Madwell described the payment as purchase bldg, increasing net corporate cash in the personal-account route to \$2,503,688.32.

Source route: Property cash schedule

SEP 7-8

BOOK / IDENTITY RECORD

\$2,383,688.32 became Eisenman capital. The personal account funded 195 Throckmorton; the entity then sent \$2,383,076.16 to title. The recovered route leaves \$120,000 without a final endpoint.

Source route: S25-S27 / property route

How the quarter worked. Control over payment or financial access; cash movement through a controlled rail; value routed to a related or personal endpoint.

Carry forward. The next quarter opens with OCT 4-17: \$1M Sojka draw left and returned.

11.3 2022 Q3: The debt-funded route reaches property

VALUE DESIGNATED FOR ZEROING	CASH RELEASED THROUGH THE RAILS	VALUE STILL HELD IN THE MACHINE
\$5.654M	\$6.815M	\$11.031M

Quarter finding. The finance layer narrowed after the Controller left, while the debt-funded personal route was completed into Eisenman's related-entity capital and property closing.

11.4 Mechanism Plate: Corporate Debt to Personal Property

The two planes prevent the economic consequence from disappearing inside one arrow: cash moved through Eisenman's personal account into his property entity, while the line-of-credit obligation remained with Madwell. The recovered route closes most, but not all, of the endpoint sequence; \$120,000 remains outside the last traced property endpoint.

Figure 11. Two-plane reconstruction of the debt-funded 195 Throckmorton route

Figure source: S19, S25–S27; CashPro worldline; property cash schedule; title and entity records.

11.5 2022 Q4: Two owners, two accounting treatments

Quarter finding. The quarter shows three uses of liquidity at once: a transparent owner roundtrip, a large client-facing media obligation, and a year-end prepayment positioned into the next year.

OCT 4-17

CASH / VALUE RECORD

\$1M Sojka draw left and returned. QuickBooks posted the Goldfinch draw and reversed it one day after the bank return, unlike the omitted Eisenman \$5 million circuit.

Source route: Owner roundtrip schedule

DEC 2

CASH / VALUE RECORD

\$385,000 CBS payment. The Drew Barrymore placement moved through QuickBooks 1072 / BILL clearing.

Source route: Address ledger / T01

DEC 30

BOOK / IDENTITY RECORD

\$361,738.16 IPH prepayment. The BILL object was labeled 2023 Prepayment and covered February through August rent.

Source route: Address ledger / T01

How the quarter worked. Temporary cash staging and return; cash movement through a controlled rail; timing shift.

Carry forward. The next quarter opens with JAN-MAR: \$2.7M left for Goldfinch and CSDE.

11.6 Mechanism Plate: Two Owner Roundtrips, Two Record Treatments

Both circuits return to company cash; neither is a permanent cash-loss amount. The evidentiary difference is the record treatment: the Sojka circuit was visible and reversed, while the Eisenman circuit was absent from the supplied controlled QBO population. That difference matters to how ownership history and liquidity were later presented.

Figure 12. Bank-closed roundtrip worldlines and their different accounting visibility

Figure source: Owner roundtrip schedule; Bank of America records; controlled QBO relationship review.

12 2023: Adverse records and the break in trust

Borrowing and client work refilled the reservoir. Lender packages, removal instructions, adverse fragments, false settlement procedures, and the December rupture show the reporting machine being used to shape both financial condition and blame before the exit.

DESIGNATED	REMOVED	YEAR-END STATE
\$17.941M	\$11.819M	\$15.116M

Each quarter figure shows the Zero Machine expanding or contracting as designated value enters and cash leaves through the two rails. The three dated records beneath it show the transactions, accounting actions, and control changes that made the quarter consequential. Exact construction is in Appendix A; source and endpoint records are in Appendices L and M.

12.1 2023 Q1: The company becomes affiliate liquidity

VALUE DESIGNATED FOR ZEROING	CASH RELEASED THROUGH THE RAILS	VALUE STILL HELD IN THE MACHINE
\$3.292M	\$1.753M	\$10.533M

Quarter finding. Madwell's line and operating account were used as a temporary reservoir for related-company capital while card-based vendor payments shifted reporting and endpoint evidence into the payment platform.

JAN-MAR

CASH / VALUE RECORD

\$2.7M left for Goldfinch and CSDE. A \$750,000 line draw preceded \$1.2 million to Goldfinch; a \$1 million draw preceded \$1.5 million to CSDE. Within 60 days, \$2.61 million returned as reimbursement.

Source route: 2023 bank schedule

FEB 21

BOOK / IDENTITY RECORD

\$50,930.59 Washington Post VCard. The exact 2023 obligation later ties to a returned 1099, showing how card payment and tax-document delivery could diverge.

Source route: 1072 / returned-1099 bridge

MAR 3

BOOK / IDENTITY RECORD

\$79,010 Mansueto VCard. A media-buy obligation was funded through the 1072/BILL stack but converted to the card-reporting rail at payout.

Source route: Address ledger / T04

How the quarter worked. Temporary cash staging; card-funded extraction rail.

Carry forward. The next quarter opens with APR 17: \$383,718.75 Scholar payment.

12.2 2023 Q2: Equity moves without cash

VALUE DESIGNATED FOR ZEROING	CASH RELEASED THROUGH THE RAILS	VALUE STILL HELD IN THE MACHINE
\$4.573M	\$2.358M	\$12.748M

STATE TUBE AND QUARTERLY FLUX

PHASE TRAJECTORY^{18M} carried

Figure 13. 2023 stock, flux, and phase

Figure source: Quarterly stock-flow control; four reconstructed quarter states and rail components.

Quarter finding. The books acknowledged the owner-capital disparity without moving cash, while the lender-facing package changed revenue and loss without changing COGS.

APR 17

CASH / VALUE RECORD

\$383,718.75 Scholar payment. The first 75 percent Visible production invoice moved through QuickBooks 1072 / BILL clearing.

Source route: Address ledger / T01

MAY

BOOK / IDENTITY RECORD

\$1,422,619.16 equity true-up. Tucker and M&S transferred half of Eisenman's opening capital to Sojka in the books without moving cash or returning the property-route money.

Source route: S25-S27

JUNE

BOOK / IDENTITY RECORD

\$256,181 changed the lender result. The Published package added pass-through revenue and improved net result by exactly \$256,181 while COGS stayed unchanged; instructions said remove cannabis and update ratios for David.

Source route: S32

How the quarter worked. Cash movement through a controlled rail; noncash reallocation; audience-specific presentation.

Carry forward. The next quarter opens with JUL 12: \$2.5M-\$3M staff-cut model advanced.

12.3 2023 Q3: The adverse fragment omits the ending

VALUE DESIGNATED FOR ZEROING	CASH RELEASED THROUGH THE RAILS	VALUE STILL HELD IN THE MACHINE
\$4.122M	\$3.175M	\$13.695M

Quarter finding. A real contract problem was isolated into an adverse narrative while the missing commercial resolution and the successful million-dollar deal continued through the same production economy.

JUL 12

CONTROL RECORD

\$2.5M-\$3M staff-cut model advanced. During Sojka's family emergency, Eisenman and Sherman advanced an unapproved restructuring while Tucker supplied the forecast privately.

Source route: S14-S16

AUG 29-30

BOOK / IDENTITY RECORD

Visible crisis was preserved without its ending. Tucker opened a narrow crisis channel; Sojka moved the contract through Starfish, the solution was accepted, and the \$1 million all-fee deal succeeded.

Source route: S14-S16

SEP 21

CASH / VALUE RECORD

\$131,379.92 Team Companies payment. The pooled obligation includes Jason Alexander production-house cost from the campaign whose resolution was missing from the adverse fragment.

Source route: Address ledger / T01

How the quarter worked. Control over payment or financial access; selective adverse record; cash movement through a controlled rail.

Carry forward. The next quarter opens with DEC 12: \$200,000 Millwright payment.

12.4 2023 Q4: False settlement becomes written procedure

Quarter finding. The quarter ends with the written mechanism itself: false Paid and Received states could be reconciled to zero without the represented cash, just as Sojka demanded forensic review.

DEC 12

CASH / VALUE RECORD

\$200,000 Millwright payment. The Geeked Week build moved through the 1072 / BILL rail shortly before the written offset procedure.

Source route: Address ledger / T01

DEC 20

BOOK / IDENTITY RECORD

\$6,834,735.57 later bank-disproved. Tucker's procedure instructed processors to mark A/P Paid, A/R Received, post equal opposites, and reconcile because they offset to zero. The first adverse Paid states appeared that day.

Source route: S32 / settlement population

DEC 20-22

CONTROL RECORD

Sojka demanded forensic accountants. After the burning-house exchange, Sojka said he would fire Tucker and asked Eisenman to meet; the personal repair cycle no longer restored trust in the finance structure.

Source route: S14-S16

How the quarter worked. Cash movement through a controlled rail; obligation extinguishment without cash; owner challenge to financial control.

Carry forward. The next quarter opens with JAN 15: Approximately \$8M of gains modeled as sheltered.

12.5 Mechanism Plate: The Written Zeroing Controller

The controller can force the book state to zero without proving cash settlement. The feedback loop is the bank test. It divides the exact population into supported and bank-disproved routes; the \$6.835 million face amount is an accounting-state population, not a separate cash-theft total.

Figure 14. Closed-loop control model of the written offset procedure

Figure source: S32; intercompany settlement population; bank-absence validation; 108-pair classification.

13 2024: The terminal drain and transfer

The year contains no new filed-return comparator; it is a terminal clearing view. The seller's tax model, access struggle, failed-wire rewrite, related-entity transfers, ownership settlement, and successor-platform installation converged as the carried field was drained.

DESIGNATED	REMOVED	YEAR-END STATE
N/A	\$15.287M	\$171,072.32 terminal overage

Each quarter figure shows the Zero Machine expanding or contracting as designated value enters and cash leaves through the two rails. The three dated records beneath it show the transactions, accounting actions, and control changes that made the quarter consequential. Exact construction is in Appendix A; source and endpoint records are in Appendices L and M.

13.1 2024 Q1: The seller's tax result organizes the exit

Quarter finding. The seller's tax result was modeled while Sojka, the remaining fifty-percent owner, still had to obtain his own company's bank, books, and card access through the existing control group.

JAN 15

BOOK / IDENTITY RECORD

Approximately \$8M of gains modeled as sheltered. Belfer confirmed the basis, loss carryover, and negative K-1 calculations; Eisenman summarized the first \$8 million as approximately tax free.

Source route: S35

FEB 12

CONTROL RECORD

\$15M Eisenmann Transaction. Belfer transmitted Anchin's seller-side transaction and tax workbook while Sojka was still acquiring AMEX access.

Source route: S36

MAR 4-22

CONTROL RECORD

Bank was told first; Sojka fought for access. Tucker informed Bank of America copying Eisenman. Sojka refused to sign without unrestricted QBO and became AMEX primary only on March 22.

Source route: S14-S16 / S18-S19 / S23

How the quarter worked. Tax-year positioning or tax presentation; seller-tax and exit modeling; control over payment or financial access.

Carry forward. The next quarter opens with APR 25: \$500,000 sent to fund Starfish.

13.2 2024 Q2: The failed wire enters the successor books

Figure 15. 2024 stock, flux, and phase

Figure source: Quarterly stock-flow control; four reconstructed quarter states and rail components.

Quarter finding. The transition quarter combined related-entity funding, a personnel handoff, and a bank failure that the successor books would later convert into false owner history.

APR 25

CASH / VALUE RECORD

\$500,000 sent to fund Starfish. The Maple Syrup & Jam BILL object moved through 1072 and was coded to Security Deposits.
Source route: Address ledger / T01

MAY 5-13

CONTROL RECORD

Green entered; Ieong became CFO. Green joined the transition channel while Sojka promoted Tucker-supervised Russell Ieong to CFO after Tucker’s full-time exit.
Source route: Transition records / Ieong audit

JUN 12-13

CASH / VALUE RECORD

\$1,100,008.08 failed, returned, then succeeded. The first attempt returned \$45 short; the exact amount was resent and received the next day. The economic transfer was company to company.
Source route: S31 / bank records

How the quarter worked. Cash movement through a controlled rail; succession of financial control; failed-wire concealment and re-classification.

Carry forward. The next quarter opens with JUL 8-AUG 30: \$900,000 to Tiny Giant Sounds.

13.3 2024 Q3: A forty-five-dollar event becomes 2.200 million

VALUE DESIGNATED FOR ZEROING	CASH RELEASED THROUGH THE RAILS	VALUE STILL HELD IN THE MACHINE
N/A	\$2.979M	\$66,427.59 overage

Quarter finding. Cash moved into related entities while the replacement accounting layer converted a nullified company-wire cycle into a false statement that Sojka withdrew and restored \$1.1 million.

JUL 8-AUG 30

BOOK / IDENTITY RECORD

\$900,000 to Tiny Giant Sounds. A \$400,000 cash transfer and a later \$500,000 transfer moved through 1072 / BILL before another \$250,000 followed on September 30.
Source route: Address ledger / T01

AUG 19

CONTROL RECORD

Two separate \$25,000 exits shared date and amount. Chase paid Fatking Films while Bank of America separately paid AMEX / Malaky. The old reconciliation had fused them; native records preserve two objects and \$50,000 total movement.
Source route: Twin-\$25K adjudication

SEP 9

BOOK / IDENTITY RECORD

\$45 event became \$2,199,971.16 of owner activity. The Bautista-named QBO account cycled transfer, unmatched, delete, journal, reconciliation, and expense states until the failed wire became a Sojka draw and return became his contribution.
Source route: S31

How the quarter worked. Related-entity cash transfer; matched-cadence dual cash exits; false owner-equity history.

Carry forward. The next quarter opens with OCT 2-3: \$1.325M paid with one account at \$352.47.

OPENING STATE \$2.913M

CLOSING STATE \$0.066M overage

DESIGNATED N/A

1072 / BIMALAKY-NAMED ACH + OTHER AMEX CASH \$2.795M

\$0.184M

net unclassified-check offset +0.000M

\$0.066M overage

Confidential work product - prepared for counsel

30

13.4 Mechanism Plate: Failed-Wire Hysteresis

Hysteresis means the output state depends on the path taken, not merely the original input. The bank event was a company-to-company transfer that failed, returned \$45 short, and then succeeded. The later edit path converted that event into gross owner activity more than twice the transfer amount.

13.5 2024 Q4: Legal ownership changes before control

VALUE DESIGNATED FOR ZEROING	CASH RELEASED THROUGH THE RAILS	VALUE STILL HELD IN THE MACHINE
N/A	\$104,644.73	\$171,072.32 overage

Quarter finding. Legal ownership transferred before financial control did. Near-zero liquidity, a matching bank demand, false Paid history, and successor-system bootstrap carried the machinery into the post-transfer period.

OCT 2-3CASH / VALUE RECORD

\$1.325M paid with one account at \$352.47. The settlement required complete control delivery, gave Eisenman 195 and Discofries, and gave Sojka Madwell with debt, defaults, and incomplete permissions.
Source route: S37 / EX-19

OCT 21CASH / VALUE RECORD

\$23,500 returned while Paid survived. Creative Peaks is the closed example of processor cash returning to the bank while the BILL Paid state remained in place.
Source route: Funding-return adjudication

DEC 3-6CONTROL RECORD

Ramp users and all four approval classes were built. The Cin account created the first user and configured the approval system before the BUSINESS_OWNER account first acted on December 20.
Source route: S28-S29

How the quarter worked. Ownership transfer paired with liquidity movement; returned cash while a paid state survives; successor-platform control.

Carry forward. The quarter sequence ends here; the platform and record afterlife continues in the next chapter.

13.6 Mechanism Plate: The 2024 Terminal Boundary

The terminal year contains a measured release but no new filed-return comparator. The body therefore begins with the \$15.116 million state carried from 2023 and pinches to zero under the \$15.287 million release. The \$171,072 difference is a scalar overage, not a negative bank balance or a separately identified cash object.

Figure 16. Hysteresis between the bank event and the later ledger state

Figure source: S31; native bank records; Bautista-named QBO audit; failed-wire reconstruction.

Figure 17. Collapse of the modeled carried field at the 2024 terminal boundary

Figure source: Annual and quarterly stock-flow controls; QBO 1072 credit projection; Malaky / AMEX cash projection.

14 Real bills supplied the camouflage

The payment system did not separate ordinary vendors from an adverse rail. It used the same vendors through different routes, often inside the same year, quarter, month, or day. That is the operational point: a recognizable vendor and a real obligation could supply the commercial story while the system selected a different cash route, payment state, or invoice allocation for the individual transaction.

Story plate 1. The same vendor population moved through both routes. The route was not a fixed vendor attribute.

POSITIVE VALUE THROUGH BOTH ROUTES	SWITCHED WITHIN THE SAME MONTH	USED BOTH ROUTES THE SAME DAY
289 vendors	92 vendors	8 vendors
What the evidence establishes. The complete BILL population contains 10,499 Paid objects totaling \$188.010 million. Within it, 7,368 objects totaling \$120.048 million were assigned to 1072 and 3,131 totaling \$67.963 million were assigned elsewhere. The \$188.010 million is a platform denominator, not another loss amount.	Why real bills do not answer the operation. A real obligation explains why a payment-shaped record existed. It does not prove which Madwell funds satisfied it, whether the same bank event was assigned to another obligation, whether the vendor profile changed, or where the release ultimately settled. The legitimate business supplied the camouflage.	

Figure source: Complete BILL Paid population; 1072/non-1072 vendor crossover and route-switch schedules; legal-memorandum validation.

15 A Paid state was not proof of settlement

The system could preserve a platform Paid label after cash returned, or reuse one real bank debit to support a second payment story. Bank settlement and accounting state were separable facts. The controls matter: where the bank supports settlement, the analysis says so; where it disproves the represented route, the contradiction is retained.

CREATIVE PEAKS: THE MONEY RETURNED; THE PAID STATE SURVIVED

REDDIT: ONE DEBIT, TWO PAYMENT STORIES

Story plate 2. A real cash event could be returned while Paid survived, or could be reassigned to a second set of invoice obligations without a second debit.

EXACT A/P-A/R PAIRS	BANK-SUPPORTED CONTROLS	REPRESENTED ROUTE DISPROVED
108 / \$10.562M	65 / \$3.728M	43 / \$6.835M

Consequence. The Reddit record carried \$50,000 of Paid stories around one \$25,000 debit. That is not proof of a second \$25,000 cash loss. It is proof that one settled event could be duplicated, rerouted, and assigned to different obligations inside the record. The 43 bank-disproved A/P-A/R pairs show the same separation at population scale.

Figure source: Creative Peaks bank/QBO/BILL chain; Reddit bank and payment-object schedule; false-settlement bank validation.

16 The historical books were rebuilt 38 days before settlement

The 2024 conversion was not a passive transfer of an old file. It created a new companywide billable-charge layer, rewrote the historical invoice population in two narrow bursts, and was followed immediately by tax preparation, authorization, and settlement. The record proves the scale and sequence even though the platform label *Import Administration* does not identify the human at the keyboard.

Story plate 3. The source layer changed before the return and settlement. Chronology alone does not assign every tax line to the import; it does defeat the premise that the delivered books were an untouched historical record.

FIRST INVOICE BURST	SECOND INVOICE BURST	PRE-2024 INVOICES TOUCHED
1,760 / \$191.187M	382 / \$15.533M	1,958 / \$182.214M

The invoice rewrite was concentrated. The first burst ran from 11:59:38 a.m. to 12:06:10 p.m.; the second from 2:10:25 p.m. to 2:20:58 p.m. Cin Bautista authentications enclose both windows, but the modifying actor recorded by QBO is *Import Administration*. The physical operator requires Intuit's session and device records.

The billable-charge layer was a record construction. The live file contains 62,152 nonposting objects totaling \$216.772 million; 99.95 percent of the rows and 99.86 percent of the value were created by the import actor on August 22–23. These are not additional payments or losses. They are the reconstructed customer-billing layer placed over historical costs.

Figure source: Current QBO invoice report, invoice audit windows, and live all-dates Unbilled Charges report.

17 The import selected which identity survived

The migration preserved exact dollars while selectively removing, retaining, or rebuilding identity. Three independent populations show that this was not a neutral file conversion: client and project fields disappeared from matched revenue rows; Nicole Brunner's terminated employee identity became the sole active employee wrapper in the live charge layer; and a separate net-zero packet rebuilt historical descriptions and deleted customers into 2024 sales objects.

IDENTITY STRIPPED

1,587 fee-revenue rows / \$49,673,519.50 survive the Desktop-to-QBO conversion at matching dates, transaction types, numbers, and amounts.

Across **232 matched account-40065 journal sets**, every Desktop row carried Client and Project. Every corresponding QBO Name field is blank.

Meaning: dollar survival is the control. The change is in the commercial address attached to those dollars.

IDENTITY RETAINED

Nicole Brunner was terminated **November 17, 2016**. No reviewed record attributes a later system act to her.

Yet QBO displayed **Nicole Brunner(E)** as Madwell's only active employee and retained **215 imported Billable Expense Charge rows / \$103,509.88** under her name. All were created and modified by *Import Administration*.

Two rows that lacked any customer/job in the final 2016 export acquired customer assignments in the current lineage.

IDENTITY REBUILT

A separate packet carrying Doug Fischer's account identity contains **197 lines**: 167 invoice lines and 30 credit-memo lines in account 22040.

It carries **\$378,472.20 positive** and **\$378,472.20 negative** and nets to exactly zero while placing historical expense descriptions and deleted-customer identities into paired 2024 sales records.

The evidence supports Fischer as an unwitting execution point, not a knowing designer.

A named-user control confirms selection after import. QBO history shows a \$192,825 GF 620 Park bill imported with both lines in Loans Receivable. On April 8, 2025, the Cin Bautista account moved only the \$100,000 "deposit to VOA" line to Deferred Expenses while the \$92,825 line remained in Loans Receivable. The cash itself is traced penny for penny through BILL and the recipient bank. The named event proves a selective field change; it does not, by itself, prove Bautista's purpose or instruction source.

Figure source: Desktop-to-QBO fee-revenue match; Nicole identity and live Unbilled Charges reconstruction; Fischer packet; GF 620 native QBO history and bank/BILL chain.

18 The 2023 return begins after a \$6.970 million transformation

The prepared return did not inherit either surviving set of books. January cash-basis books showed a \$5.858 million loss. The prepared Schedule M-1 claimed the books already showed \$1.113 million of positive income. The \$6.970 million change occurred before the disclosed M-1 bridge and remains unsupported by the final tax trial balance or account mapping.

Story plate 4. The Schedule M-1 starts after the unexplained change; it does not disclose it.

THREE INCOMPATIBLE PRESENTATIONS

Presentation	Income	COGS	Gross profit
Jan. cash	\$33,903,377.37	\$15,304,294.63	\$18,599,082.74
Feb. accrual	\$41,187,596.83	\$17,844,049.70	\$23,343,547.13
Prepared 1065	\$23,246,885.00	\$0.00	\$23,246,885.00

Prepared sales are only **\$96,662.13 below** accrual gross profit. That is strongly consistent with gross-profit-as-sales substitution. The missing tax mapping is required to assign the exact account mechanics.

Both capital accounts were forced to zero. The return records \$4,078,143 as a “due from partner” while placing it in current liabilities and using it as a capital increase: \$2,206,977 to Eisenman and \$1,871,166 to Sojka. Without those allocations, the return’s own Item L arithmetic ends at the exact corresponding negative amounts.

Sequence and attribution. Eisenman and Belfer discussed approximately \$8 million of basis and loss shelter on January 15, 2024; Belfer transmitted the \$15 million *Eisenmann Transaction* model on February 12. The historical QBO rewrite followed in August; Anchin prepared the return on September 4; Sojka authorized the package presented on September 16. This fixes the exit context and the compromised source sequence. It does not make Belfer the author of every journal or prove that the import generated every return line.

Figure source: 2023 tax-restatement evidence package; January cash books; February accrual books; prepared Form 1065 and K-1s; basis and exit-planning communications.

19 Settlement transferred the burden before it transferred control

By the ownership transfer, the carried field had been drained, the key operating account was nearly empty, Sojka's side had to borrow at extreme cost to fund the payment to Eisenman, and the successor systems held a large, internally contradictory obligation population. The settlement required complete financial-system control to be delivered. BILL's provider record shows that superior outside administration remained in place for another year.

Story plate 5. The company transferred with near-zero liquidity and a new financing burden sized around the payment to the departing owner.

CURRENT QBO NET A/P	RAMP OPEN / IN-FLIGHT FACE	CLEAN QBO BILL-FACE COMPARATOR
\$10.821M	704 / \$12.363M	\$12.060M
The inherited obligations had lost lineage. Of Ramp's 704 open or in-flight bills, 284 totaling \$5,275,029.52 were imported from QBO with Customer/Job, Category, and Class all blank. Eight obligations totaling \$115,012.15 exactly match prior A/P records marked Paid but appear open or in flight in Ramp.		The snapshots overlap. Ramp's \$12.363 million and QBO's \$10.821 million are not additive. Ramp's clean like-side comparator is the QBO bill-posting face of \$12.060 million, leaving a \$303,388.09 perimeter difference. The point is the transferred burden and contradictory state, not a second liability total.
The settlement transferred Eisenman's ownership interest on October 3, 2024 and required complete control of financial systems and bank accounts to be delivered. Madwell nevertheless remained beneath Tucker Associates Console LLC in BILL until Daniel Tucker disconnected it on October 3, 2025.		

Figure source: Settlement agreement; Bank of America balances and demand proposal; successor financing contract; Ramp/QBO obligation crosswalk; BILL provider escalation.

20 The company stopped; the record operation continued

Madwell ceased operating on April 30, 2025. The books did not freeze. Named QuickBooks and Ramp accounts continued creating, editing, approving, voiding, merging, matching, and reconciling financial objects after the business had stopped, while the superior BILL console remained attached for another five months.

Story plate 6. Legal ownership, operating status, company-facing access, and superior platform control ended on different dates.

POST-CLOSE RAMP APPROVALS	SURVIVING OBJECTS TOUCHED	POST-CLOSE QBO INVOICES
138	112 / \$1.697M	27 / \$1.623M
The invoice population includes new objects. Of 27 invoices totaling \$1,622,693.85 modified after closure, 11 totaling \$1,429,993.24 were created after closure and 16 older objects totaling \$192,700.61 were modified afterward. These are later acts, not merely old balances viewed later. Account labels are not physical-user proof. The later layer includes accounts associated with Cin Bautista, Brittany Wright, Laurie Paul, and M&S Global. The audit histories prove coordinated account-level action. Native authentication, session, device, and API records remain necessary wherever the physical operator matters. The afterlife is consequential because the transferred company was already the party carrying the unpaid obligations and public responsibility. Continued mutation could change which bills appeared paid, open, approved, classified, or attributable after the original operating evidence had ceased to be generated.		

Figure source: QBO post-close invoice and actor histories; Ramp native audit; hard-walled control finding; BILL provider escalation.

21 Federal process is documented; the remaining work is allocation

The evidentiary chronology did not begin with a government theory imposed on the archive. Sojka initiated contact. A December 13, 2024 meeting and transmission to Special Agent Thomas Kovacs are documented, and a May 30, 2025 Southern District of New York grand-jury subpoena later demanded records across the same bank, card, related-entity, accountant, and financial-misstatement surfaces now joined in this reconstruction.

DOCUMENTED CHRONOLOGY

December 13, 2024. Sojka met with Special Agent Thomas Kovacs and transmitted Bank of America materials.

March 30, 2025. A follow-up communication preserved the continuing contact.

April 30, 2025. Sojka states from firsthand knowledge that he called the FBI and agents were present when Madwell closed. The held record does not independently establish the physical-presence fact.

May 30, 2025. An SDNY grand-jury subpoena demanded records concerning, among other subjects, Malachi, Goldfinch, CSBE, Bank of America credit, Anchin and Belfer, financial misstatements, and Eisenman card use.

Boundary. The subpoena proves an investigation and its scope. It does not establish target status, guilt, endorsement of this reconstruction, or outcome.

FIVE PRODUCTIONS CLOSE THE OPEN ENDPOINTS

1. **American Express:** master hierarchy, authorized users, native settlement and funding identifiers, credits, rewards, refunds, and cash-redemption destinations.
2. **BILL:** superior-console history, payment-time vendor profiles, payout tokens, SentPay and processor disbursements, and generated, voided, or reissued checks.
3. **Intuit and hosted systems:** import job, session, device, IP, API, audit, deletion, merge, and export history for the August 2024 bursts and later object work.
4. **Banks:** receiving-account ownership, ACH and wire addenda, negotiated checks, endorsements, onward movement, and know-your-customer records.
5. **IRS and Anchin:** accepted returns, MeF acknowledgments, tax trial balances, account mappings, adjustment reports, basis schedules, and preparer-review files.

The procedural ask is narrower than the proof already assembled. The locally held records establish the operated system, its control structure, its accounting method, its scale, its principal release rails, its exit rewrite, and its transferred burden. Institution-held records allocate final recipients, physical users, return-line consequences, and individual techniques within that established operation.

Figure source: Prior federal-contact chronology; Bank of America transmittal email; May 30, 2025 grand-jury subpoena; institution-held completion register.

22 Conclusion: one operation, carried through to exit

The evidence is not a collection of anomalies. It is one chronological operation. Madwell created value in public. Eisenman selected the result. Tucker professionalized the method and controlled the decisive systems with Eisenman. The method removed the company's scale while preserving the chosen remainder; the payment architecture released a nearly identical field; the historical books were rebuilt during the exit; and the depleted company and its obligations were transferred to Sojka while superior control persisted.

Story plate 7. Each stage is independently evidenced; the causal force comes from the sequence.

CAPTURED ECONOMIC FIELD	RECONSTRUCTED RELEASE	TERMINAL DIFFERENCE
\$141,578,371.18	\$141,749,443.50	\$171,072.32 / 0.12%

Controlling conclusion. Madwell's controlled financial system removed \$141,578,371.18 from the company's reported economic identity, released a nearly identical amount through the principal payment architecture, rewrote the historical source record during the exit, and transferred the depleted company and its obligations to Sojka. The two macro amounts are overlapping views of the same operation, not additive damages. Real bills do not create an innocent partition; they supplied the substrate through which route, state, identity, and obligation could be changed.

What remains open is allocation, not existence. American Express, BILL, Intuit, banks, the IRS, and Anchin hold the records needed to identify terminal recipients, physical operators, payout profiles, tax adjustments, and precise consequences within the field. Those records can complete attribution. They do not reopen whether the operated system existed.

**THE COMPANY CREATED THE VALUE.
THE MACHINE REMOVED ITS IDENTITY, RELEASED THE CASH,
AND LEFT THE COMPANY CARRYING WHAT REMAINED.**

EVIDENCE BACKUP

Schedules, proof controls, source routes, and nonadditivity boundaries

The live argument ends on the preceding page. The following appendices preserve the quarter model, AMEX and 1072 geometry, worked chains, negative controls, proof grades, atomic techniques, source routes, contracts, client disposition, and the controlling non-regression rule. They are reference material, not additional loss populations.

A Quarterly Stock–Flow Schedule

The quarter schedule below is the exact input to every quarter figure. Dated 1072 and canonical Malaky events are observed by transaction date. Other AMEX-coded cash and the net unclassified-check offset are allocated as described in Methods. Field input and carried difference are modeled. Values are millions of dollars; 2024 input is N/A, not an observed zero.

Quarter	Phase	Input	1072/BILL	AMEX cash	Net offset	Carry
2018Q1	six-year field	4.462	0.000	1.945	0.006	2.523
2018Q2	six-year field	4.192	0.000	1.336	0.004	5.382
2018Q3	six-year field	2.634	0.000	1.974	0.006	6.048
2018Q4	six-year field	8.980	0.772	3.418	0.007	10.845
2019Q1	six-year field	3.730	2.532	1.379	-0.003	10.661
2019Q2	six-year field	1.032	2.828	1.323	-0.003	7.538
2019Q3	six-year field	4.641	2.380	1.527	-0.003	8.269
2019Q4	six-year field	12.005	4.602	1.966	-0.004	13.702
2020Q1	six-year field	4.798	7.299	1.803	-0.001	9.399
2020Q2	six-year field	1.773	4.864	1.091	-0.000	5.215
2020Q3	six-year field	7.623	2.929	0.423	-0.000	9.486
2020Q4	six-year field	3.986	3.533	0.248	-0.000	9.691
2021Q1	six-year field	11.024	7.093	0.287	0.143	13.478
2021Q2	six-year field	7.761	8.731	0.260	0.122	12.370

Quarter	Phase	Input	1072/BILL	AMEX cash	Net offset	Carry
2021Q3	six-year field	10.513	5.595	0.546	0.068	16.810
2021Q4	six-year field	10.262	8.967	0.632	0.171	17.644
2022Q1	six-year field	5.163	8.489	0.785	0.087	13.619
2022Q2	six-year field	9.213	9.901	0.791	0.052	12.193
2022Q3	six-year field	5.654	6.293	0.574	0.052	11.031
2022Q4	six-year field	4.192	5.820	0.450	0.041	8.995
2023Q1	six-year field	3.292	1.688	0.111	0.046	10.533
2023Q2	six-year field	4.573	2.346	0.081	0.068	12.748
2023Q3	six-year field	4.122	3.142	0.108	0.074	13.695
2023Q4	six-year field	5.954	4.471	0.180	0.118	15.116
2024Q1	terminal-release coda	N/A	4.389	0.283	0.000	10.444
2024Q2	terminal-release coda	N/A	7.378	0.153	0.000	2.913
2024Q3	terminal-release coda	N/A	2.795	0.184	0.000	-0.066
2024Q4	terminal-release coda	N/A	0.071	0.034	0.000	-0.171

Quarter carry is $S_q = S_{q-1} + D_q - R_q$. The input column is a statement-field allocation, not literal quarterly cash deposited into a segregated account. The AMEX column combines transaction-dated canonical Malaky events with the allocated other-AMEX remainder; the underlying distinction remains in the machine-readable schedule.

B AMEX/Malaky Competing-Hypothesis Test

B.1 Chronology

The earliest documented topology is a disclosed 2011 credit accommodation, not a proved fraud at inception. By 2013, historical bank records preserve Bernard/Malaky descriptors across American Express, Citi, and Barclays. In 2016–2017, 57 Bank of America-funded American Express-liability rows totaling \$6,263,203.10 carry Malaky/Bernard descriptors. The later BILL.com/CashPro/Swizznet stack scales a topology in which upstream identity, company-facing use, accounting treatment, and payment authority can remain on different surfaces.

After BILL.com became dominant, the old rail remained live. In 2022 it carried 29 settlements totaling \$2,017,425.87 across ten months; in 2023 it carried 16 totaling \$315,622.13 across eleven months. All 45 close by exact date and cents

to issuer workpapers and QuickBooks Online liability records. The correct sequence is precursor, scaled replacement, retained fallback. It was not dormant and then reactivated.

B.2 Population and hypotheses

The broad American Express-coded cash family contains 329 events totaling \$23,889,198.00. The canonical Malaky subset contains 242 Bank of America events totaling \$23,113,582.79; the other 87 events total \$775,615.21. Within the canonical subset, 202 events totaling \$20,560,504.46 close to issuer statements or controlled workpapers; 40 totaling \$2,553,078.33 do not. The full bank amount closes to QuickBooks Online American Express-liability treatment through \$23,113,577.35 of ordinary components and one \$5.44 bank-only event.

The ordinary-settlement and release-rail hypotheses are not rhetorical positions; they make different document predictions. Ordinary settlement predicts a native issuer settlement ID binding the company-bank debit to the corporate card hierarchy and its charge obligations. Release-rail use predicts a different funding profile, parent account, credit/refund path, or duplicate external payment of the represented expense. The held record is sufficient to identify the cash exit and identity wall, but not to inspect the decisive native issuer fields. Cap-and-penny limits, a second hidden-card file, INDN-as-recipient, zero visible matches, and a complete self-cleaning refund loop are withdrawn theories and are not used.

C QuickBooks 1072 and BILL Endpoint Geometry

The canonical 1072 surface contains 7,368 BILL.com Paid objects totaling \$120,047,590.39. It is an object-level view, not the same grain as the \$118,907,831.50 QuickBooks Online credit-side macro control. The last-local-door partition is exact:

- 3,877 objects / \$63,119,253.90: exact native bank batch/member;
- 1,895 / \$37,484,673.86: bank clearing without a native individual member;
- 1,534 / \$17,012,858.66: BILL object only;
- 55 / \$2,140,677.87: individual named bank payee; and
- 7 / \$290,126.10: partial native batch.

The named-payee class fixes the cash-side payee, not receiving-account ownership or entitlement. The remaining classes end at a platform, aggregate batch, or incomplete bank surface. Payment-time vendor/profile history, pay-out token, processor disbursement, generated or negotiated check, receiving-account ownership records, and vendor acknowledgment are the last-door production.

The difference between the 7,368-object surface and the QuickBooks Online credit-side macro view is \$1,139,758.89. It is a representation-perimeter difference, not a beneficiary or loss. The paper keeps those grains separate.

D Worked Evidence Chains

D.1 A client job crosses from workpaper to bank rail

A sealed 2020 bridge joins 29 workpaper job codes to BILL by complete job-code prefix, then to payment objects by controlled vendor/invoice key, and finally through Funds Transfer Detail and native bank batches. Seventeen codes recover 87 invoice objects totaling \$2,314,151.39, or 80.8923 percent of the \$2,860,779.40 workpaper actual-cost population. Eighty-four obligations totaling \$1,093,456.91 travel through 1072; three totaling \$1,220,694.48 travel directly through account 10010. This is an executable job-to-obligation-to-rail bridge; it does not assert that workpaper revenue, cost, accrual, invoice, and bank movement are additive.

D.2 Zarbee's: receipt, suppression journal, and funded vendor children

A \$150,060 Zarbee's receipt closes from the native Bank of America event to a QuickBooks Online cash receipt. Journal number 20072702 contains a separate four-leg \$150,060 identity transformation and, under the same journal number/date label but a different native transaction ID, \$171,009.03 of account-1072/Bank of America funding. That funding closes to a native bank event, BILL.com batch, and nine children. The same journal context and client/job

family establish the operating bridge; because \$150,060 is not \$171,009.03 and cash is fungible, the record does not assign title to particular dollars.

D.3 The two \$25,000 exits on August 19, 2024

Two authenticated cash exits occurred on the same date and for the same amount. Chase account 7672 sent a \$25,000 wire to Fatking Films and QuickBooks Online reduced the accounts-payable balance. Separately, Bank of America sent \$25,000 under the Malaky / American Express descriptor, closing to issuer card 1003 and an American Express-liability journal. An older date-and-amount join fused their attributes. The current record preserves both objects and uses the collision as a negative control: exact date and cents alone do not establish identity.

E Accounting Mechanics and False Settlement

Madwell's integrated model makes gross-versus-net presentation the primary statement mechanism. Where Madwell or an affiliate performed work and earned margin, equal revenue and cost could be removed while gross profit survived. Six internal statements total \$279,544,475.18 of Total Income; six filed returns total \$137,966,104.00 of gross receipts; the difference is \$141,578,371.18.

The written false-settlement procedure creates a different result. Equal accounts payable (A/P) and accounts receivable (A/R) can be marked Paid and Received through method Other, equal-and-opposite bank-ledger entries can net to zero, and reconciliation can close without the represented cash movement. Of 108 exact pairs totaling \$10,562,497.34, 65 totaling \$3,727,761.77 are bank-supported and 43 totaling \$6,834,735.57 are bank-disproved. The 65 are mandatory controls; the 43 prove false represented settlement, not an equal amount of stolen cash.

F Control Planes, Migration, and Post-Closure Reconstruction

Bank of America's CashPro portal divided maker and approver roles while concentrating root administration. In the bounded native audit, all 368 successful Payment IDs were finally approved by Tucker or Eisenman; 359 complete maker/approver lifecycles used different creating and approving accounts. BILL.com remained under the Tucker Associates console from Oct. 31, 2018 until Oct. 3, 2025. The Swizznet hosted environment held the master ledger, workpapers, connectors, backups, and recovery state.

The migration from QuickBooks Desktop to QuickBooks Online preserved all 1,587 numeric 2022–2023 fee-revenue rows totaling \$49,673,519.50; it did not delete the revenue dollars. It did strip Client/Project identity from all 232 matched account-40065 journal rows while preserving date, number, memo, and amount. Ramp then inherited an incomplete object and vendor lineage. Its lifetime denominator is 913 bill objects totaling \$14,734,087.01; platform states such as *Paid manually*, *Ready for payment*, and *Ready for release* are not external settlement.

Named QuickBooks Online and Ramp accounts for Bautista, Wright, Paul, Gupta, and Varma continued exact-object work after operations ceased. The record closes account-level coordination across 149 shared QuickBooks Online objects, including four touched by all three principal named QuickBooks Online accounts, plus 113 QuickBooks Online-to-Ramp handoffs. Authentication and session records remain necessary for physical-user attribution.

G Corrections and Negative Controls

The following controls are part of the finding, not footnotes against it:

- Ten ordinary one-bank-event-to-many-BILL allocations totaling \$1,014,217.28 show that pooled allocation can be legitimate.
- A \$150,000 SiriusXM bank payment is genuine; four later BILL objects reconstruct its allocation. It is not a false-payment or nonreceipt row.
- Sixty-five intercompany pairs totaling \$3,727,761.77 have bank support and remain beside the 43 disproved pairs.
- HITENY's \$43,000 was funded by a sibling entity; "unfunded Paid" is withdrawn.
- Pacific World to Proyecto is a native vendor merge, not an unresolved identity fork.

- Positive BILL Funding Return values are usually actual bank debits; one Creative Peaks \$23,500 event is the closed return/Paid-persisted exception.
- An ApproverAudit result is a failed export, not evidence of deletion or destruction.
- Same-day, same-merchant, same-amount cross-card Divvy patterns are review signals, not duplicate cash proof.
- Amount-and-timing matches in remote-deposit-capture work are candidates unless the physical check or native deposit item closes identity.
- The \$141.578 million presentation spread is not proceeds or loss; 99.88 percent scalar closure is not beneficiary identity.

H Actor and Attribution Ledger

The body table controls the concise actor chronology. Four attribution rules govern the appendices. First, system capability is not proof that every object was altered. Second, a named platform account is not automatically the natural person at the keyboard. Third, custody of Tucker-derived records proves provenance and continuity, not collusion. Fourth, functional hierarchy can be established from recurring control at gates without inventing a literal employment or supervision relationship not in the record.

I Benefits, Burdens, and Nonadditivity

The reconstructed benefits and burdens are stated by episode. Direct routes include the 195 Throckmorton property transaction, related-entity liquidity deployment, owner-history inversion, temporary roundtrips, and selected corporate-card or processor paths. Burdens include company debt, vendor obligations, employee and contractor shortfalls, lender and tax presentation, and post-transfer liabilities. A benefit amount is not automatically loss; returned funds are not permanent loss; gross deployment is not net retention; and institution reliance or assessed government loss requires the institution's own records.

No amount in the paper is added merely because it appears in more than one layer. The statement spread and cash release are paired projections. BILL and 1072 are container/object representations. AMEX charges and settlements overlap. False-settlement face value measures represented obligations. Mutation and post-close counts are investigative surfaces. The same economic episode is counted once at its terminal result.

J Institution-Held Completion Records

1. **American Express:** master account and card hierarchy; native settlement and funding identifiers; authorized users; merchant/acquirer settlement; credits, rewards, refunds, and cash redemption; know-your-customer ownership records.
2. **BILL:** historical vendor and profile versions; payment-time vendor ID, network ID, and payout token; Sent-Pay/processor disbursement; VCard settlement; generated, negotiated, voided, and reissued checks.
3. **Ramp and Divvy:** native payment ID and account; processor settlement; source-object lineage; card credential/device history; credits and refunds.
4. **Banks:** receiving-account identifiers, automated-clearing-house and wire addenda, negotiated check images and endorsements, know-your-customer ownership records, onward movement, and property/title records.
5. **Intuit and hosted systems:** authentication, session, IP/device, audit, migration, deletion, merge, and export history sufficient to attribute physical users and recover prior states.
6. **Tax, lender, and government institutions:** submitted packages, signers, corrections, decisions, reliance, forgiveness/refund treatment, examinations, assessments, and calculated loss.
7. **Vendors and clients:** acknowledgments, remittances, invoice and payment histories, contractual rebate/credit treatment, and unpaid-obligation records.

K Proof Grades, Limitations, and Validation

The proof ladder is P0 capability / control; P1 mutation or state conflict; P2 cash to an intermediate platform; P3 named counterparty or bank payee; P4 receiving-account owner confirmed; P5 retention or onward use confirmed; P6 adverse diversion and resulting benefit or burden proved. P0–P2 are not labeled theft. P3 does not establish beneficial ownership. P4 and P5 still require entitlement and purpose analysis.

The central limitations are explicit. The quarterly path depends on within-year allocation even though annual results do not. The source archive does not yet enumerate every \$141.578 million statement-field dollar as a lot. Bank cash is fungible, so job, journal, batch, and amount conservation establish controlled bridges but not title to dollars absent unique identifiers. Some platform exports omit historical profiles, payout tokens, or settlement records. Legal conclusions, intent, damages, government loss, and physical-user identity are outside the mechanical findings unless the cited record closes them.

The release validator checks quarter coverage, all current denominators, source-route closure, removal of superseded language, appendix continuity, PDF searchability, absence of absolute local paths in the rendered document, and the package hashes. Mechanical validation does not substitute for source interpretation.

L Atomic Techniques and Their Last Doors

The catalog contains 48 atomic techniques. A technique may tag the same economic episode as another technique; the rows are not additive. “Proof state” identifies what the current record closes. “Next record” identifies the institution-held evidence required to finish the route.

ID	Technique	Rail/system	Current proof state	Last door and required production
T01	Pooled funding and private decomposition	BofA; BILL; QBO 1072	PROVED CONTAINER; NOT RECIPIENT PROOF	Aggregate bank-to-BILL movement or BILL object, depending on the row; next: Payment-time profile/ version; processor disbursement; receiving account; bank KYC; vendor acknowledgment
T02	ACH or international destination substitution	BILL ACH; BILL IntLEPmt	CANDIDATE DIVERSION	BILL/processor; the export does not identify the effective payout token on each payment; next: BILL payment-time payout token; SentPay/ACH/FX trace; receiving-bank KYC; onward use
T03	Check payee or mailing-address substitution	BILL check; bank check; QBO; 1099	PAYEE CONFLICT PROVED; ULTIMATE OWNER OPEN	Named check payee on bank image; next: Generated and negotiated check image; endorsement; deposit account; receiving-bank KYC; vendor acknowledgment
T04	Card or VCard rail conversion	BILL; Divvy; VCard; AMEX	RAIL CONVERSION PROVED; MERCHANT ENDPOINT OPEN	BILL/ card issuer or aggregate card settlement; next: Virtual-card token; network authorization and settlement; merchant/ acquirer account owner; refund path; Form 1099-K issuer record
T05	Vendor Direct route	BILL; QBO 1072	ROUTE CELL PROVED; ENDPOINT UNADJUDICATED	BILL object / 1072 member; next: Vendor Direct native disbursement record; payment-time profile; bank settlement; receiving owner
T06	Direct wire or ACH to personal account	CashPro; BofA	BANK ROUTE PROVED TO NAMED BENEFICIARY ACCOUNT	Beneficiary account ending 6973 named to David Eisenman; next: Full receiving statement/ KYC; onward transfers; purpose and authorization; personal and entity tax treatment
T07	Corporate borrowing converted to personal/ property capital	BofA credit; CashPro; 6973; 195 Throckmorton	PROPERTY ROUTE PROVED; \$120K ENDPOINT OPEN	195 property / closing for traced portion; 6973 for unresolved \$120K; next: 6973 and 195 statements; escrow ledger; deed; sale/ refinance; K-1 and capital schedules
T08	Affiliate and property-network deployment	Direct bank; CashPro; intercompany	GROSS DEPLOYMENT PROVED; NET BENEFIT VARIES BY EPISODE	Named affiliate/ property accounts; next: Both sides’ statements; entity ownership; authorization; return/ repayment; deed/ title; recipient use
T09	Pre-settlement affiliate drain and replacement debt	BofA; Chase; affiliates; Orca; IOLTA	CASH TIMING AND NET OUTSIDE AMOUNT PROVED; ENTITLEMENT OPEN	Named affiliates; then Weiss IOLTA for settlement payment; next: Affiliate statements and purpose; IOLTA ledger; seller disbursement; Orca repayment; authorization
T10	U.S.-to-Hong-Kong cash export followed by receivable writeoff	BofA/ CashPro; Hong Kong bank; QBO 16030	NET OUTWARD CASH AND WRITE-OFF PROVED; FOREIGN BENEFICIARIES OPEN	Hong Kong bank / named foreign counterparties where present; next: Complete HK statements; wire addenda; beneficiary KYC; invoices/ vendor confirmations; FX and writeoff approval
T11	Foreign direct bank or FPS route	HK CashPro/ FPS; international wire	COVERAGE GAP / UNADJUDICATED	Foreign bank or named beneficiary fragment; next: HK statement; beneficiary KYC; invoice; vendor acknowledgment; both-side intercompany treatment
T12	Entrusted client funds retained while named vendor remains unpaid	Client bank deposit; BILL; Ramp; QBO	RECEIPT AND VENDOR DEPRIVATION PROVED; ONWARD USE OPEN	Client cash enters Madwell bank; creditor burden remains at SiriusXM; next: Source/ use after each deposit; SiriusXM remittance ledger; BILL payout; bank statement; creditor acknowledgment
T13	Processor return while Paid state survives	BofA; BILL; QBO	RETURN AND FALSE STATE PROVED; DOWNSTREAM USE OPEN	Madwell bank after return; next: Subsequent bank use; BILL cure/ reissue history; payment-time profile; vendor acknowledgment
T14	Client-owned rebate, reward, or refund retained upstream	Divvy; AMEX; BofA; client job ledger	KNOWN COMPANY RECEIPTS; CLIENT ENTITLEMENT UNRESOLVED	Madwell 2105 or reduced company card liability; next: Issuer reward/ credit ledger; original charge mapping; client contract; job allocation; client credit memo
T15	Void/ return/ reissue recycling	BILL; BofA; QBO 1072	LIFECYCLE PROVED; EXTRA NET RELEASE NOT GENERALLY PROVED	Returned company cash and later reissued processor object; next: Processor subledger and settlement for each reissue; receiving endpoint; intervening bank use
T16	Duplicate Paid state or reopened obligation	BILL; QBO 1072; Ramp	STATE DUPLICATION / SECOND-RELEASE OPPORTUNITY; NOT SECOND CASH BY ITSELF	Platform state; one bank event where located; next: Independent settlement for every object; receiving record; return/ reversal netting
T17	Cash-first, payable-later backfill	CashPro/ direct wire; BILL; QBO	BANK OUTFLOW AND RETROSPECTIVE CONSTRUCTION PROVED; PURPOSE/ ENTITLEMENT VARIES	Named bank counterparty or bank recipient; later BILL objects; next: Receiving owner/ entitlement; original instruction; invoice; contemporaneous authorization; full AP history

ID	Technique	Rail/system	Current proof state	Last door and required production
T18	Split-rail execution	CashPro; online transfer; bank return	ROUTE FRAGMENTATION PROVED; ADVERSE PURPOSE OPEN	Named bank rails and return; next: Recipient statements; original instruction; return purpose; final retained amount
T19	Temporary balance or capitalization staging	Bank; owner/affiliate; QBO	ROUNDTRIPS PROVED; TARGET BENEFIT PARTLY OPEN	Same source bank after return; temporary recipient account during interval; next: Recipient statements; application screenshot; lender/program file; QBO audit; use during interval
T20	False A/P-A/R settlement	QBO; M&S workpapers; named banks	FALSE SETTLEMENT PROVED FOR REPRESENTED ROUTE	Accounting state; actual economic receivable/payable remains unresolved; next: Alternative-rail search; client remittance; vendor receipt; actual A/R and A/P disposition
T21	One cash event produces two accounting benefits	QBO; bank; AMEX	DUPLICATE BOOK BENEFIT PROVED; NO SECOND CASH	Reduced QBO revenue/loan/AP/card liabilities; next: Uncapped audit; creditor/issuer confirmation; source support for each reduced balance
T22	Bank reality rewritten into owner draw/contribution history	Bank; QBO equity	FALSE OWNER HISTORY PROVED	Sojka capital/basis ledger and responsibility narrative; next: Uncapped Intuit audit; every K-1/basis schedule; filed owner returns; settlement use
T23	Debt, collateral, and guarantee burden left behind	BofA line; Orca MCA; guarantees; settlement	DEBT/BURDEN DOCUMENTED; CAUSAL AND ENTITLEMENT DETAILS VARY	Company and guarantor balance sheets; lender rights; next: Underwriting, borrowing-base, waiver, collateral, enforcement, and use-of-proceeds files
T24	Investor or creditor identity conversion	Bank; QBO; capitalization and debt schedules	CASH RECEIPT AND LATER IDENTITY CHANGE PROVED; LEGAL TERMS OPEN	Changed creditor/equity claim against Madwell; next: Signed subscriptions/notes; source-account KYC; cap table; repayment schedule; creditor confirmation
T25	Capital true-up without return of cash or property	QBO; M&S capital schedules	NONCASH TRUE-UP PROVED; AUTHORITY/TAX EFFECT OPEN	Owner capital accounts; next: Authorizing agreement; amended K-1s; tax workpapers; settlement treatment
T26	Integrated revenue and cost eliminated together	QBO; workpapers; returns; statements	PRESENTATION MECHANISM PROVED; JOB-LEVEL BENEFICIARY/LOSS OPEN	Filed returns/statements and reduced company scale; next: Job contracts; principal-agent analysis; client and vendor settlements; return adjustments; lender/tax reliance
T27	Deferred-revenue cycling and contra-account compression	QBO; monthly close workpapers	ACCOUNTING MOTION PROVED; ECONOMIC ENTITLEMENT OPEN	Deferred revenue and reporting period; next: Invoice; delivery/acceptance; customer A/R; final tax mapping; job-level settlement
T28	Tax-year cash positioning and receipt/deduction timing	Bank; QBO; tax workpapers; returns	TIMING AND FILED INPUTS PROVED; TAX LOSS/HOOK OPEN	Filed tax treatment / owner tax credits; next: Final adjusted GL; preparer adjustments; IRS/NYS transcripts; owner credits; lease/vendor confirmations
T29	Government aid or forgiveness obtained through transformed classifications	PPP/SBA; ERC/IRS; bank; QBO	BENEFIT RECEIPT PROVED; ELIGIBILITY/RELIANCE VARIES	Madwell bank, reduced revolver, SBA forgiveness, or IRS credit account; next: Applications and signers; lender/SBA/IRS decision records; eligible-cost and controlled-group files; use of proceeds
T30	Lender-facing period or balance staging	QBO; bank; bank and lender packages	PRESENTATION DIFFERENCE PROVED; RELIANCE OPEN	Lender-delivered package / bank balance on measurement date; next: Native delivered file; version history; certification; underwriting calculation; reliance testimony
T31	Payroll and employee expense shifted to affiliates	Justworks; QBO; intercompany	ACCOUNTING SHIFT PROVED; REIMBURSEMENT/ENTITLEMENT OPEN	Entity expense and intercompany balances; next: Employee time/job assignment; affiliate invoice; actual reimbursement; entity returns
T32	Employee compensation or benefit value retained	Payroll; Justworks; benefit providers	WAGE DELAY DOCUMENTED; REBATE/PLAN EXTRACTION PARTLY OPEN	Employee claim or payroll-provider/company boundary; next: Employment terms; payroll registers; ACH; rebate ledger; participant-level plan records; employee claims
T33	Vendor identity replacement on continuing object	BILL; QBO; Ramp; 1099	IDENTITY FORK PROVED; RECIPIENT VARIES	BILL/QBO/Ramp identity layer; cash endpoint often upstream; next: Payment-time profile; processor payout; receiving KYC; vendor confirmation
T34	Tax identity, 1099 flag, and recipient-copy address mutation	QBO; Ramp; 1099	MUTATION/NONDELIVERY PROVED; CAUSATION VARIES	Filed/current tax record or returned recipient copy; next: Filed/corrected IRS forms; payment-time profile; USPS/registry; vendor acknowledgment; KYC
T35	Card payment shifts Form 1099 reporting party	BILL card; Divvy; AMEX; 1099-K	REPORTING-LANE SHIFT PROVED; PSE REPORT/RECIPIENT OPEN	Payment-settlement entity / card network; next: PSE 1099-K filing; merchant account; payout token; recipient acknowledgment
T36	Ramp import strips lineage and auto-approves state	QBO -> Ramp	LINEAGE LOSS AND APPROVAL STATE PROVED; EXTERNAL CASH OPEN	Ramp bill and approval state; next: Source object history; external bank/check/processor settlement; payment-time recipient
T37	Scheduled payment unscheduled and marked Paid manually	Ramp	STATE CONCEALMENT PROVED; PAYMENT OPEN	Ramp manual state; next: External bank/check/processor settlement; recipient owner; source used to populate paid date

ID	Technique	Rail/system	Current proof state	Last door and required production
T38	Approval step removed or authority rewritten	Ramp; CashPro; BILL	CONTROL CHANGE PROVED; NOT A VALUE TRANSFER	Platform authorization state; next: Native session / device / IP; policy versions; actual external release; signer authority
T39	Post-close delete, void, credit, merge, or 1099-history rewrite	QBO; Ramp; BILL; 1099	OBJECT-LEVEL CLEANUP PROVED	Current mutable QBO / Ramp / 1099 state; next: Uncapped audit; filed / corrected forms; preserved historical versions; authentication logs
T40	QBD-to-QBO lineage severance	Swizznet / QBD / QBE -> QBO	DOLLAR SURVIVAL AND IDENTITY LOSS PROVED	QBO ledger with blank Name; next: Intuit migration maps and audit; native pre / post company files; subsequent customer reports
T41	Inbound payer or purpose substitution	RDC; BofA; QBO	PHYSICAL / BANK IDENTITY CONFLICT PROVED; DOWNSTREAM USE OPEN	Madwell 2105 deposit; next: Original remittance; deposit ticket / RDC session; A / R application; downstream use
T42	Gross bank movement compressed to net book event	BofA; deposit ticket; QBO	BANK MOVEMENT AND NET BOOKING PROVED	BofA adjustment and \$8K ledger entry; next: BofA adjustment metadata; item images; QBO audit; source / use of \$100K
T43	Cardholder / entity / job coding split	Divvy / card; QBO	CODING CONFLICT / REVIEW SIGNAL; DUPLICATE COLLECTION NOT PROVED	Issuer transaction and company job coding; next: Issuer / acquirer transaction IDs; merchant settlement; cardholder / session; receipt; client billing tie-out
T44	AMEX / Malaky upstream identity wall	BofA; AMEX; QBO	IDENTITY WALL PROVED; NOT ADDITIVE EXTRACTION	AMEX master hierarchy / issuer settlement; next: Issuer master / card hierarchy; payment profile; settlement ID; authorized users; merchant / refund / reward destination
T45	Positive funding-return field reverses actual cash direction	BILL; bank	FIELD-SIGN CONFLICT PROVED	BILL field versus bank direction; next: Bank-native cash direction; processor subledger; payment lifecycle
T46	Export block or partial local visibility	BILL; ApproverAudit; QBO	PRODUCTION OBSTACLE PROVED; DELETION NOT PROVED	Processor object / failed export state; next: Platform-native export logs; console audit; source object history; settlement and recipient records
T47	Selective non-reconciliation at closure	Chase 6976; QBO	SELECTIVE GAP PROVED; OUTCOME ENDPOINTS OPEN	Individual Chase bank events; QBO omits them; next: Beneficiary / addenda for every outflow; Chase user / approval logs; uncapped Jan-Apr Intuit audit
T48	Terminal-period liability backfill	QBO; M&S workpapers; successor close	BACKFILL EFFECT PROVED; UNDERLYING OBLIGATIONS NEED ADJUDICATION	Reconstructed 2024 ledger; next: Native pre-reconstruction books; creation audit; invoice support; creditor / client confirmations

M Principal Source Routes

The source register is a navigation layer, not a substitute for claim-level manifests. The printed register omits absolute local paths. The release package contains the exact path, hash, role, and boundary for every route. R01–R84 are current governing routes; S01–S79 preserve the human-scene and first-party source lineage used by the quarter body.

Key	Source / role	Use boundary or locator
R01	Current integrated claim and correction view	Derived orientation; first-party packages control facts
R02	Mandatory supersession and withdrawal gate	Must be run against prose and figures before release
R03	Human chronology and scene routing	Earlier friendship-led title and burning-house placement are not governing editorial choices
R04	Thirty-two scene-level causal units	Use source IDs through its manifest; do not import unsupported connective prose
R05	Reader-order and context prerequisites	Editorial audit, not factual authority
R06	August 3 business/pass-through narrative base-line	Quantitative Malaky and other later-corrected claims are superseded
R07	Integrated-agency economics, architecture, reproducibility, core source family	Follow exhibit/source manifests; later correction packages supersede old grains
R08	Worked mechanisms, property route, false settlement, scale controls	Mechanism totals overlap and are not additive damages
R09	Canonical BILL/1072 populations and grain correction	‘Paid’ and near-zero do not prove vendor endpoint
R10	Last-door BILL endpoint classification	BILL-object-only class is a production target, not proof of nonpayment
R11	Transaction sequences, property-route operator timing	Platform account is not automatically natural person
R12	CashPro authority, maker/checker, 2105-to-6973 population	Classify each benefit route transaction by transaction
R13	Disproved/narrowed AMEX theories	Cap/penny, two-card, endpoint, zero-match, and complete refund-loop claims cannot return
R14	Canonical 242-event bank population and 202-event issuer/workpaper closure	Corporate settlement population, not additive outflow
R15	Charge substrate, client attribution, overlap with settlements	Charges and settlements are different grains and overlap economically
R16	2011–2017 identity chronology and later hard-wall continuity	Original issuer contract, hierarchy, profile endpoint, and refund route remain institution-held
R17	October 2017 financial controls and trial-balance correction	Spell the person Hayley; preserve literal ‘/Haley files/’ paths only
R18	Household loan and liquidity bridge	Loan source is not proved to be a HELOC
R19	Rogers’s authority, control build, displacement, and handoff	Do not assign a fraud-suspicion motive without a source
R20	Desired-result chronology and operator commissioning	Tucker’s sworn direct Anchin line names Mark Neuman; 2017 recruiting agreement does not name Tucker
R21	Eisenman outcome selection across periods	Preserve distinction between instruction, delegation, execution, and later output
R22	Tucker Associates superior BILL console and life-cycle	Capability does not prove every object was altered
R23	Hosted master-ledger/workpaper/backup custody	Custody is not collusion
R24	Exact dollar survival and 232-row customer/project identity loss	Do not call it deletion of revenue dollars
R25	Ramp setup, permissions, imports, and post-close event populations	Counts are snapshot- and event-class-specific
R26	Tucker-derived backup provenance and Cin access	Possession does not prove collusion or deliberate handoff
R27	QBO account-level multi-actor coordination	Named account does not close keyboard identity
R28	QBO/Ramp vendor destinations and payment-method mutations	Object changes are not automatically diverted-dollar totals
R29	Failed-wire bank/QBO responsibility inversion	Use bank reality and ledger labels separately
R30	Direct relationship/control chronology, 2019–2025	Human context; do not diagnose personality or import venting into report claims
R31	Tax inputs and year-specific reconstruction	No aggregate tax loss without authority records and applicable hook
R32	Transfer/collapse and financing sequence	Later corrections and native packages govern conflicting counts or characterizations
R33	Exact-fact coverage gate	Mechanical coverage does not substitute for semantic reading
R34	Section, figure, route, and scene preservation framework	Rebind to the future source hash and update for Malaky chronology
R35	User directions, inquiry chronology, private/report-use boundaries, version acceptance	Conversation is not first-party transaction proof
R36	Claim-development and version-status router	Derived; later corrections control facts
R37	Full Monthly Close transformation, provenance, creator/modifier, Jeong/M&S/controller workpaper layer	Turnover is accounting motion, not additive loss; metadata is workflow evidence, not automatic decision authorship
R38	Integrated operator hierarchy and M&S engagement/control chronology	Derived synthesis; follow its exhibit routes and later corrections
R39	Bautista/M&S Ramp actions, approvals, vendor and payment fields, post-close work	Named accounts do not automatically authenticate people; early export is snapshot-specific
R40	Lifetime Ramp successor-layer actions by Bautista, Wright, Paul, and M&S	Keep lifetime and earlier bounded populations distinct

Key	Source / role	Use boundary or locator
R41	Multi-profile vendor adjudication, resolved corrections, Copley fork, payment-time-profile gap	Profile conflict is not automatically theft or diverted cash
R42	Check 812, Voa / Franklin, Estudio / Big Bang, and other closed identity transformations	False accounting identity does not alone name the final beneficiary
R43	Mutually exclusive mutation / no-mutation-visible partitions, last-door intersections, receiving-record production	“No mutation found” is not “stable” or “legitimate”; mutation surfaces overlap other schedules
R44	Full 10,499 BILL Paid object universe and vendor-change crosswalk	Row-level derived denominator and change crosswalk; use sealed R55, not an ad hoc join, for strict destination timing
R45	QBO / Ramp / 1099 cross-platform identity and object continuity	Crosswalk populations overlap and do not authenticate every natural person
R46	Jeong role progression, Tucker reporting line, operational functions, and authority perimeter	Proves supervised operations, not that Tucker recruited Jeong or that Jeong designed the architecture
R47	Tucker’s April 2019 invitation of M&S partner Druman Patel into the Tucker Associates Teams environment	Invitation and access are closed; full-purpose knowledge is not
R48	December 2018 contemplated M&S staffing and review structure	Draft / engagement context; do not conflate contemplated start with proved live production
R49	Madwell–M&S agreement signed April 29, 2019, effective May 1	Establishes formal outsourced production layer; not every processor’s knowledge
R50	Mariea-Gorkin controller role and July 15, 2022 separation	Custody and role do not prove authorship of each journal or strategic knowledge
R51	Tucker employment termination and advisory / transition sequence	Distinguish full-time termination from later advisory work and persistent BILL console control
R52	Green–Tucker transition chronology, accounts, entities, insurance, signatures, and settlement	Messages prove exchanges and acts; not authorship of every draft or original-system design
R53	Bautista / Wright / Paul shared QBO objects, exact signatures, and post-close coordination	Named-account workflow; physical operator and whole-scheme knowledge remain separate
R54	Actor-export windows and material / post-close QBO action populations	State selected account set and date window with every count
R55	Sealed 34-object strict-after and three-object same-date destination-mutation timing schedule, including identity-safe Alana bridge	Candidate destination substitution only; payout-time token, processor history, and receiving-bank KYC remain missing
R56	Canonical 7,368-object 1072 last-door schedule and individual bank-payee controls	Individual bank payee is not final receiving-account ownership or economic entitlement
R57	Canonical 10,499-object BILL Paid universe and mutually exclusive last-door disposition	Bank support often ends at an aggregate platform object, not final beneficiary
R58	Full BILL vendor / operator substrate, payment-lineage controls, mutation union, and missing historical profile fields	A real obligation may coexist with a changed payout profile; no-event is not proof of legitimacy
R59	Sealed mutually exclusive A / B1 / B2 classification for every one of the 10,499 BILL Paid objects	A proves named-bank-payee agreement only; B1 is an adverse-evidence union; B2 is residual proof-disabled, not legitimate receipt
R60	Definition, waterfall, reason union, nonadditivity, and reproducibility for the exact A / B1 / B2 tree	Derived and hash-sealed; follow the source manifest and independent validation
R61	Complete BILL lifecycle, route, state, return, reissue, and last-door orientation	‘Paid’, a BILL object, and 1072 are intermediate states unless external settlement and recipient close
R62	All 17 mutually exclusive BILL payment-account / route × method cells	Platform route is not beneficiary proof; dollar fields contain harmless floating-source residue beyond cents
R63	All nine mutually exclusive BILL last-local-door cells	“Last local door” is not automatically recipient owner or entitlement
R64	Void, bank return, 1072 repair, exact reissue, and route-switch lifecycles	Proves recycling; duplicate theft requires two non-returned settlements
R65	Positive-sign inversion and actual return / Paid-state adjudication	Most positive Funding Return rows are actual bank debits, not returns
R66	Full, partial, and mostly absent payable backfill; duplicate-state controls	SiriusXM \$150,000 is a genuine recipient payment with later allocation construction, not a theft row
R67	Full false-settlement population and three adverse variants	Preserve the 65 supported pairs and six grouped-wire controls; face value is not cash loss
R68	Complete 913-object Ramp lifetime denominator and manual-payment / state history	Ramp state is not external settlement; counts are lifetime-export specific
R69	Three one-event / two-benefit accounting closures and ordinary duplicate-import controls	Unsupported second book benefit is not additional cash loss
R70	Related-entity deployment, returns, net outside amount, Orca replacement cash, settlement liquidity	Cash-availability bridge; recipient entitlement and final use remain separate
R71	PPP1 / second-round PPP / ERC receipt, use, forgiveness, and eligibility-input reconstruction	Agency / lender decisions and legal eligibility control loss; program populations are separate
R72	Paired revenue / cost elimination, deferred-revenue cycling, and six-year scale	Presentation scale and movement concordance are overlapping, not proceeds
R73	Exact cross-entity funding-source substitution correction	HITENY \$43,000 was sibling-funded; do not revive “unfunded Paid”
R74	Complete validated Divvy / card cross-card, card-holder, job-route, and BILL bridge patterns	Same-day / card patterns are review signals, not proved duplicate collection
R75	Complete 17,959-transaction Divvy denominator and credit population	Parallel status / card / job views overlap; credits require original-charge and disposition linkage

Key	Source / role	Use boundary or locator
R76	Bank absence testing for the represented settlement routes	Absence disproves the represented bank route, not every possible alternative route
R77	Route transitions, generic-label removal, and funding-return sign controls	Cadence and label changes are mechanisms; not automatic diversion
R78	Payroll, employee, benefit, rebate, and Justworks production	Partial rebate/benefit samples cannot be extrapolated; participant records control
R79	Native bank events for rewards, refunds, deposits, returns, and route adjudication	Bank event closes cash direction, not necessarily contractual entitlement or final benefit
R80	Forty-eight atomic techniques, proof states, last doors, next records, and nonadditivity	Derived catalog; each row must route to the named governing source
R81	Reproducible BILL, Ramp, and Divvy denominator coverage	Platform coverage is not a theft or loss schedule
R82	Twenty complete economic sequences showing how rails, mutations, accounting states, and burdens combine	Each recipe ends at the last independently visible holder or state and names the next institution-held record
R83	Hash-bound routing from every catalog technique to its governing source	Manifest records provenance only; the catalog controls proof state and use boundary
R84	Package-level completeness, endpoint, recipe, denominator, source, and corrected-partition checks	Mechanical validation does not transform candidates or intermediate rails into proved theft or damages
R85	Controlling Zero Machine operation-level conclusion and non-regression rule	Controls existence, function, exfiltration verb, termination, and downstream allocation scope.
R86	Validated contract-to-cash and payment-disposition synthesis	Client and payment-object association does not by itself establish title to dollars or receiving-account ownership.
R87	Same-period Verizon/Visible versus filed-company scale control	The 2018–2024 legacy row is a scale comparison; the 2018–2023 controlled remap is the same-period test.
R88	Complete client-address and six-class disposition join for all 10,499 BILL Paid objects	Native client/job address and last-held-record class; no invented split of multi-client objects.
R89	Client-addressed 1072/BILL clearing subset	Client identity identifies the economic obligation, not the receiving-account owner.
R90	Quarter-by-client receipt, accounting, clearing, and endpoint-state comparison	Parallel quarter views are not additive and do not assign a particular receipt to a particular payout.
S01	Happy Family growth anchor (validated derived finding; 2016-2018)	Locator: Slack messages 2016-06-17 and 2018-05-22; source table.
S02	Hong Kong origin anchor (validated derived finding; 2017-2018)	Locator: Slack sequence 2017-08-07 through 2018-06-06; source table.
S03	October 2017 trial-balance finding (reproduced finding; 2017-10)	Locator: Sections 1-4; revenue, gross profit, net income, receivables and unbilled revenue.
S04	Hayley and Richard Rogers emergency funding finding (reproduced finding; 2017-2018)	Locator: December 2017 payroll chronology; repayment section.
S05	Parallel finance rail anchor (validated derived finding; 2017-2018)	Locator: Authority split and card-priority exchanges.
S06	Private Tucker installation anchor (validated derived finding; 2018-05 to 2018-09)	Locator: May-June reporting conflict; July-August access and succession sequence.
S07	Financials Hayley sent to Wells Fargo (first-party workbook; 2017)	Locator: Profit and Loss tab; 2017 totals.
S08	2018 Revenue Recognition workbook (first-party workbook; 2018)	Locator: Pipedrive-derived full-year model; client/job/type/owner fields.
S09	Billing flow chart workbook (first-party workbook; 2018-10)	Locator: Worked \$100,000 media invoice example.
S10	Client Billing presentation (first-party presentation; 2018)	Locator: Billing authority and Transaction Pro workflow slides.
S11	QBO to QuickBooks Enterprise conversion notes (first-party document; 2018-10)	Locator: Conversion-status and open-item sections.
S12	QBO-QBE reconciliation workbook (first-party workbook; 2018-10)	Locator: Account-total reconciliation tabs.
S13	Fresh Tucker OneDrive additions integrated finding (integrated derived finding; 2016-2019)	Locator: Chronology and causal synthesis; source map.
S14	David Eisenman and Christopher Sojka iMessage history (first-party communication record; 2019-2025)	Locator: Timestamped messages; locators in S15 and S16.
S15	Sealed iMessage closed-record finding (closed-record finding; 2019-2025)	Locator: Findings 1-15; source-bound quotes and chronology.
S16	Sealed iMessage event chronology (closed-record chronology; 2019-2025)	Locator: Timestamped event rows with source locators.
S17	Hard-walled control finding (integrated derived finding; 2018-2025)	Locator: Control-by-system chronology and convergence sections.
S18	AMEX Malaky hard-walled-control finding (validated derived finding; 2011-2024)	Locator: Administrator and settlement reconstruction sections.
S19	CashPro hard-walled-control finding (validated derived finding; 2018-2024)	Locator: Dual Administration; access chronology; \$2.6 million wire reconstruction.
S20	CashPro three-year all-user access audit (first-party bank workbook; 2021-2024)	Locator: User entitlement events and May 2022 payment events.
S21	BILL control-plane finding (validated derived finding; 2018-2025)	Locator: Console attachment and October 2025 disconnection chronology.

Key	Source / role	Use boundary or locator
S22	BILL. Executive Escalations case 07031011 (first-party provider document; 2025)	Locator: Provider confirmation and October 3 disconnection record.
S23	Swizznet and QuickBooks Desktop custody chronology (validated derived finding; 2018-2019)	Locator: Hosting invoices; file structure; cross-system invoice example.
S24	Swizznet file structure workbook (first-party workbook; 2018-2019)	Locator: Drive-map rows for company files and finance folders.
S25	QBD-to-QBO account-40065 migration finding (reproduced finding; 2022-2024)	Locator: Matched-row and customer/project-loss calculations.
S26	Pre-migration QuickBooks Desktop sales-by-customer source (first-party workbook; 2022-2023)	Locator: Account-40065 journal rows with Client and Project.
S27	Post-migration QuickBooks Online P&L detail (first-party workbook; 2024)	Locator: Matched account-40065 journal rows and Name field.

S75	David substitutes Tucker for Hayley in Verizon finance (first-party Slack JSON; 2018-08-14)	Locator: Message array indices 14-26.
S76	Finance records David's repeated demand to remove Harvest journals (first-party Slack JSON; 2018-08-27)	Locator: Message array indices 2-3.
S77	Hayley reports Tucker initially supports representing Harvest labor (first-party Slack JSON; 2018-08-28)	Locator: Message array index 1.
S78	Post-Tucker-meeting answer rejects Harvest journals (first-party Slack JSON; 2018-09-28)	Locator: Message array indices 0-7.
S79	Daniel Tucker personal employment history (first-party notarized disclosure; 2017-03-01 to 2018-11-01)	Locator: Employment-history pages; Anchin start and departure, Madwell CFO start.

N Contract and Economic-Substance Register

The contract records establish the commercial rules surrounding fees, budgets, outside costs, approvals, audit, markup, rebates, credits, and vendor payment. Components from the same instrument are nested and are not added to the instrument total.

Client	Instrument	Component	Amount	Source-bound meaning
Verizon	2019 annual LOA	AGENCY FEE	\$10,249,223.00	Flat fixed annual fee
Verizon	2019 annual LOA	ESTIMATED OOP	\$15,955,000.00	Pre-approved case-by-case OOP
Verizon	2020 annual LOA	AGENCY FEE	\$8,117,506.00	Flat fixed annual fee
Verizon	2020 annual LOA	ESTIMATED OOP	\$10,240,000.00	Pre-approved case-by-case OOP
Verizon	2022 annual LOA	AGENCY FEE	\$11,792,145.00	Annual fee; source table carries \$11,792,145.21
Verizon	2022 annual LOA	ESTIMATED OOP	\$14,360,000.00	Pre-approved case-by-case OOP
Verizon	2023 annual LOA	AGENCY FEE	\$5,860,294.82	Annual fee
Verizon	2023 annual LOA	ESTIMATED OOP	\$5,850,000.00	Estimated OOP
Jobs Ohio	2020-2021 Agency SOW	TOTAL BUDGET	\$12,600,000.00	Not-to-exceed total
Jobs Ohio	2020-2021 Agency SOW	AGENCY FEE	\$1,690,000.00	Retainer fee inside total budget
Jobs Ohio	2021-2022 Agency SOW	TOTAL BUDGET	\$16,637,571.00	Fees, OOP and media combined
Jobs Ohio	2021-2022 Agency SOW	AGENCY FEE	\$1,700,000.00	Creative agency retainer inside total
Google	2020 Multi-App Social Campaign	MAXIMUM TOTAL COST	\$4,000,000.00	Executed SOW maximum including expenses and taxes
ACDC-Cache Bank	2022 SOW	AGENCY FEE	\$4,396,591.00	Madwell team fee
ACDC-Cache Bank	2022 SOW	OOP COSTS	\$2,080,000.00	Production and legal OOP budget
Zarbee's	2020 Retainer	AGENCY FEE	\$1,529,704.00	Twelve-month retainer total
Zarbee's	2020 Retainer	MONTHLY FEE	\$127,475.00	Monthly flat fee; hours reconciled separately
Hyland Natural	FY2024 AOR Retainer	AGENCY FEE	\$1,200,000.00	Agency fee
Hyland Natural	FY2024 AOR Retainer	MEDIA SPEND AND COMMISSION	\$4,200,000.00	\$3.78M media OOP plus \$420K commission
Hyland Natural	FY2024 AOR Retainer	PRODUCTION OOP	\$600,000.00	Production OOP
Hyland Natural	FY2024 AOR Retainer	GRAND TOTAL	\$6,000,000.00	Fee plus media plus OOP; components are not additional
Everly	Q4 2021 SOW	AGENCY FEE	\$2,105,732.00	Aggregate SOW agency fee

Figure source: R86; contract component register and source manifest.

O Client-to-Payment Disposition

The table carries the largest single-client BILL payment surfaces from native client/job fields through the current disposition classes. The client address identifies the economic obligation; the payment-time payout and receiving-account owner remain separate questions.

Client	BILL objects	BILL amount	BofA receipt floor	Pay-time adverse	Later rewrite	Endpoint open
Verizon	1,989	\$54,063,887.14	\$124,249,593.50	\$4,055,558.64	\$17,654,031.44	\$8,406,999.64
Jobs Ohio	618	\$25,495,384.98	\$34,424,068.25	\$780,045.48	\$5,370,098.96	\$1,836,630.27
Zarbee's	240	\$10,057,775.69	\$19,842,383.06	\$470,479.44	\$3,639,122.46	\$91,123.57
ELF	284	\$8,490,838.94	\$12,059,052.35	\$190,403.38	\$7,465,645.06	\$5,164,413.78
Hyland Natural	119	\$3,907,001.07	\$0.00	\$37,279.59	\$3,562,124.03	\$2,000,831.53
Netflix	156	\$3,290,963.10	\$0.00	\$434,660.77	\$1,263,492.43	\$538,007.89
Fernet- Braca	304	\$2,750,434.84	\$113,500.00	\$186,171.13	\$2,372,293.99	\$1,439,439.05
Success Academy	199	\$2,588,467.99	\$6,186,100.29	\$33,302.10	\$918,231.52	\$55,900.59
Open Text	107	\$2,438,499.80	\$0.00	\$95,504.56	\$2,339,145.24	\$1,907,031.69
Inspire Energy	42	\$1,802,463.20	\$3,065,300.20	\$200,579.97	\$237,461.07	\$90,905.38
Sun-Maid	98	\$1,258,838.62	\$54,166.00	\$17,528.40	\$997,069.98	\$840,340.76
Starfish	85	\$956,059.49	\$0.00	\$223,202.06	\$707,536.63	\$449,115.92
Denon	77	\$790,407.89	\$0.00	\$11,300.00	\$141,403.61	\$108,819.48
Niantic	37	\$628,853.89	\$0.00	\$0.00	\$310,721.45	\$11,342.53
Digital Counsel	11	\$607,170.85	\$0.00	\$0.00	\$596,682.50	\$72,335.25

Figure source: R86, R88-R89; complete BILL client-disposition join.

P Client-Quarter Economic Flow

The table lists the fifteen largest client-quarter 1072 clearing loads. Receipt, QuickBooks revenue, pass-through, BILL, and 1072 are parallel views and are not additive. Multi-client objects are excluded rather than fractionally assigned.

Client	Quarter	Receipt floor	QBO recognized	QBO pass-through	1072 clearing	Endpoint open
Jobs Ohio	2022-Q2	\$5,126,201.52	\$587,509.00	\$4,606,205.79	\$6,326,118.93	\$1,214,670.10
Verizon	2021-Q1	\$10,129,574.58	\$3,121,935.00	\$10,347,914.74	\$4,868,830.02	\$1,040,232.36
Zarbee's	2020-Q1	\$4,552,020.05	\$422,975.00	\$2,536,825.40	\$4,737,142.34	\$28,504.13
Jobs Ohio	2022-Q1	\$8,958,318.11	\$887,497.00	\$5,326,379.23	\$4,187,019.58	\$0.00
Jobs Ohio	2021-Q2	\$3,837,644.64	\$422,500.00	\$3,172,197.91	\$4,061,172.46	\$8,627.50
Verizon	2021-Q4	\$9,881,375.36	\$4,646,461.00	\$5,138,168.37	\$3,560,572.91	\$259,553.29
Verizon	2021-Q2	\$8,963,728.93	\$2,979,893.70	\$2,919,542.37	\$3,118,332.21	\$344.13
Zarbee's	2020-Q2	\$3,147,866.59	\$562,425.00	\$1,743,509.53	\$2,455,973.52	\$0.00
Verizon	2021-Q3	\$2,405,126.12	\$2,661,108.00	\$4,050,816.69	\$2,250,827.12	\$767,774.81
Jobs Ohio	2022-Q3	\$1,491,749.98	\$578,749.98	\$358,000.00	\$2,032,519.20	\$290,844.77
Verizon	2022-Q2	\$5,717,995.27	\$4,265,674.16	\$1,773,340.92	\$1,999,931.46	\$278,995.89
Jobs Ohio	2021-Q4	\$2,314,041.75	\$487,497.00	\$3,530,030.79	\$1,994,267.36	\$0.00
Verizon	2022-Q3	\$8,171,672.74	\$2,817,821.93	\$1,500,168.32	\$1,894,474.20	\$12,456.36
Jobs Ohio	2021-Q3	\$2,817,655.60	\$487,497.00	\$694,704.08	\$1,870,222.41	\$0.00
Verizon	2022-Q1	\$8,009,439.06	\$2,668,437.00	\$2,695,686.54	\$1,764,137.07	\$0.00

Figure source: R90; validated client-quarter economic-flow schedule.

Q Canonical Operation Finding and Non-Regression Rules

The operation-level finding controls future synthesis. The Zero Machine produced exfiltrated Madwell value; suppressed topline fed it; the zeroing regime processed that value; QuickBooks 1072/BILL.com clearing and Bernard D. Malaky AMEX were its principal release rails; the identified principal and operator hierarchy controlled it; and the depleted legal company was transferred to Sojka as the exit mechanism.

The \$141.578 million field is not reduced to a neutral presentation difference. Missing endpoint records do not create an innocent remainder. Real vendor payments do not prove that the suppressed field funded those payments. Malaky AMEX is not reduced to an ordinary card-settlement label. The ownership transfer is not described as a rescue after an unrelated collapse. Future work grades techniques, last visible destinations, and concealed endpoints inside the established operation.

Figure source: R85; canonical Zero Machine operation finding.

R Late Evidence Routes Used in the Story Reconstruction

The September 2 briefing incorporates source-backed work completed after the August 14 master. The routes below govern the new live-deck pages. They supplement rather than replace the 169-route register above.

Key	Source family	Use boundary
LR01	Complete BILL Paid population and 1072/non-1072 vendor crossover schedules	Governs 10,499-object denominator, 322 crossover vendors, 4,067 records, \$99.852 million, and 661 switches. Populations overlap the macro field and are not additional damages.
LR02	Creative Peaks and Reddit bank/QBO/BILL chains; false-settlement validation	Governs returned-cash/Paid-state persistence, the one-debit/two-story Reddit example, and 65 supported versus 43 bank-disproved A/P–A/R pairs.
LR03	Current QBO invoice report and August 26 import-burst schedule	Governs the 2,142-invoice / \$206.720 million rewrite, 1,958 historical invoices / \$182.214 million, exact burst windows, and the <i>Import Administration</i> actor label.
LR04	Live QBO all-dates Unbilled Charges report	Governs the 62,152-object / \$216.772 million current layer and the 62,121 objects / \$216.474 million created by <i>Import Administration</i> on August 22–23, 2024. This is a nonposting record population, not a cash-loss amount.
LR05	Nicole Brunner identity sweep and live unbilled-charge reconstruction	Governs the November 17, 2016 termination, absence of later Nicole-attributed acts, only-active-employee display, and 215 imported rows / \$103,509.88.
LR06	Desktop-to-QBO fee-revenue match, Fischer packet, and GF 620 Park native history	Governs identity stripping from 232 matched journal sets, the 197-line net-zero packet, and the named April 8, 2025 selective \$100,000 field change.
LR07	2023 tax-restatement evidence package	Governs the \$6,970,287.47 pre-M-1 transformation, three incompatible source presentations, \$4,078,143 capital plug, and return-preparation sequence. It does not supply a final corrected tax liability.
LR08	Settlement, bank balance, successor financing, and Bank of America demand records	Governs \$352.47 available balance, \$930,000 net merchant-cash-advance proceeds, \$1.325 million settlement payment, and matching later bank demand proposal.
LR09	Ramp/QBO obligation crosswalk and current liability reports	Governs 704 open/in-flight bills / \$12.363 million, 284 lineage-blank imports / \$5.275 million, eight Paid/open conflicts / \$115,012.15, and the nonadditive QBO comparators.
LR10	QBO/Ramp post-close audit and BILL provider escalation	Governs 4,391 QBO material actions, 1,163 Ramp human actions, 138 approvals touching 112 objects / \$1.697 million, 27 post-close invoices / \$1.623 million, and October 3, 2025 console disconnection.
LR11	Prior federal-contact chronology, Bank of America transmittal, and May 30, 2025 grand-jury subpoena	Governs the source-backed federal chronology and subpoena scope. A subpoena proves process and scope, not target status, guilt, endorsement, or outcome.
